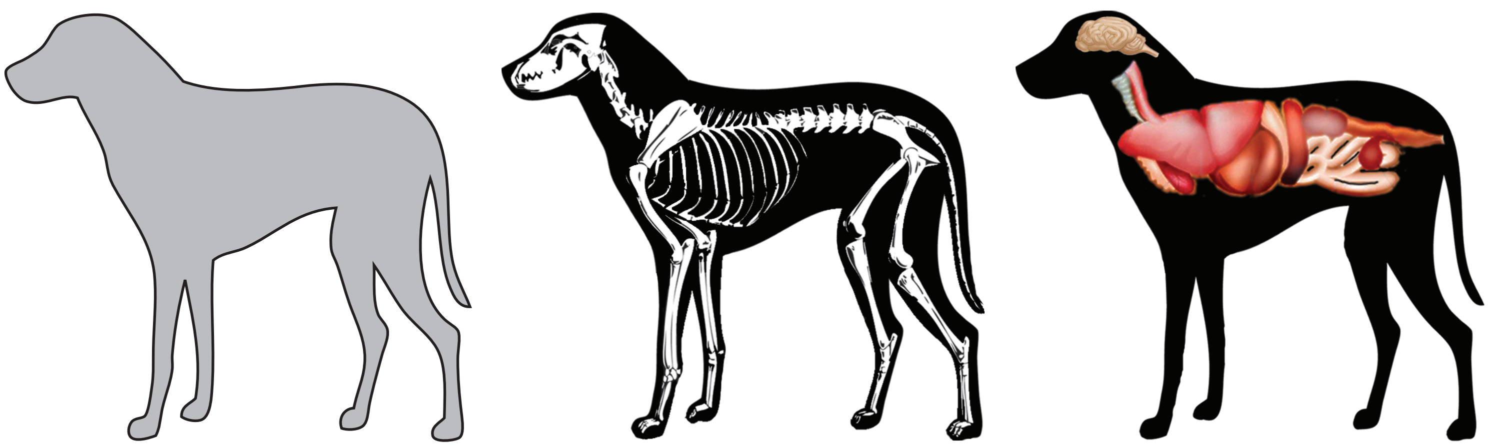
Practical guide to characterize the source of pain

1

- Complete the physical exam of the patient

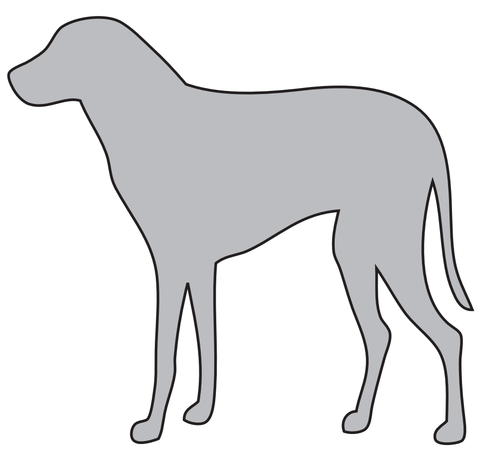
2

- Indicate with an arrow (describe the location if needed) the suspected primary source of pain



3

Primary mechanical hyperalgesia/allodynia



- In the above picture, indicate with a circle where the primary mechanical hyperalgesia[1]/allodynia[2] tests (sections 4-5) will be performed. If the primary site of pain is deep, please select a location as close as possible, or indicate N/A (non-available) in a circle.

[1] Refers to an exaggerated pain sensation in response to a normally painful stimulus
[2] The sensation of pain in response to a normally innocuous stimulus

4

Tests of primary mechanical hyperalgesia/allodynia

- Start by touching the area

☐ Normal skin temperature ☐ Warm skin temperature (*calor*)

☐ Non-applicable

- Is touching painful (*dolor*)? Y/N

- Is the area presenting redness (*rubor*)? Y/N

- Is the area presenting swelling (*tumor*)? Y/N

5

Tests of primary mechanical hyperalgesia/allodynia

Please perform all the following tests with the dog in sitting or standing position

A) Punctate tactile evaluation using the von Frey filament sensor

Repeat the test 3 times, every 10 sec

Measure 1 ____________________

Measure 2 ____________________

Measure 3 ____________________

- Wait one minute

B) Pressure threshold using the Wagner mechanical sensor

Repeat the test 3 times, every 10 sec

Measure 1 ____________________

Measure 2 ____________________

Measure 3 ____________________

- Wait one minute

C) Dynamic evaluation of response evoked by brushing

Withdrawal response was evoked after:

☐ One passage

☐ Two passages

☐ Three passages

☐ No response

6

Secondary mechanical hyperalgesia/allodynia

- Pressure threshold using the Wagner sensor (repeat the test 3 times)

First set

First site ____________________

Second ____________________

Third ____________________

Fourth ____________________

Wait one minute

Second set

First site ____________________

Second ____________________

Third ____________________

Fourth ____________________

Wait one minute

Third set

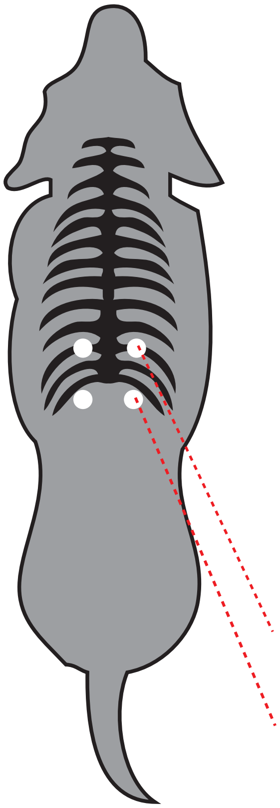
First site ____________________

Second ____________________

Third ____________________

Fourth ____________________

Please choose sites at random



On the lateral margin of the longissimus muscle, lateral to the 11th vertebra

On the lateral margin of the longissimus muscle, immediatly caudal to the 13th rib

7

Test of diffuse noxious inhibitory controls

- Gently lift up the limb of the dog and massage it from the paw towards the elbow or stifle joints.

- Place the cuff around the mid-radius or mid-tibia and inflate up to 200 mmHg

- Encourage the dog to walk around the room for 2 minute

- Repeat Wagner test at the primary site of pain (as done in #5.B)

Measure 1 (cuff inflated) __________

Measure 2 (cuff inflated) __________

Measure 3 (cuff deflated) _________

Measure 4 (cuff deflated) _________

Allow 10 seconds interval between each test.
The first two tests are done while the cuff is inflated.
The two last tests are done immediately after cuff deflation.

8

Anatomical source of cancer pain

- Determine the anatomical source of cancer pain (Multiple choices are possible)

- ☐ Somatic superficial
- ☐ Visceral
- ☐ Somatic deep
- ☐ Somatic bone

9

Mechanism of pain associated with cancer, considering your previous evaluations

- ☐ Inflammatory (positive response to *calor*, *dolor*, *rubor* and/or *tumor*)
- ☐ Neuropathic (presence of mechanical sensitivity, either punctate or dynamic)
- ☐ Skeletal (with the anatomical source)
- ☐ Articular/joint
- ☐ Combination of different mechanisms. Please describe

____

- ☐ Other, please describe

____

10

Duration of cancer pain

- Characterize the duration of the cancer-related pain

- ☐ Acute (less than 48 hours)
- ☐ Sub-acute (2 to 7 days)
- ☐ Chronic (more than 1 week)

11

Concurrent painful conditions

- Describe if there is an history or diagnosis of chronic painful conditions other than the cancer pain, such as: osteoarthritis, intervertebral disk disease, otitis, dental disease, etc. If possible, describe the severity and approximate duration of the clinical signs

____
____
____
____
____
____
____
____

12

Type of non-cancerous pain

- According to the above painful condition and assessments, classify the non-cancerous pain (Multiple choices are possible)

- ☐ Neuropathic
- ☐ Orthopedic
- ☐ Inflammatory
- ☐ Visceral
- ☐ Somatic Superficial
- ☐ Somatic Deep
- ☐ Somatic Bone

13

Duration of non-cancerous pain

- Characterize the duration of the non-cancerous pain

- ☐ Acute (less than 48 hours)
- ☐ Sub-acute (2 to 7 days)
- ☐ Chronic (more than 1 week)
