

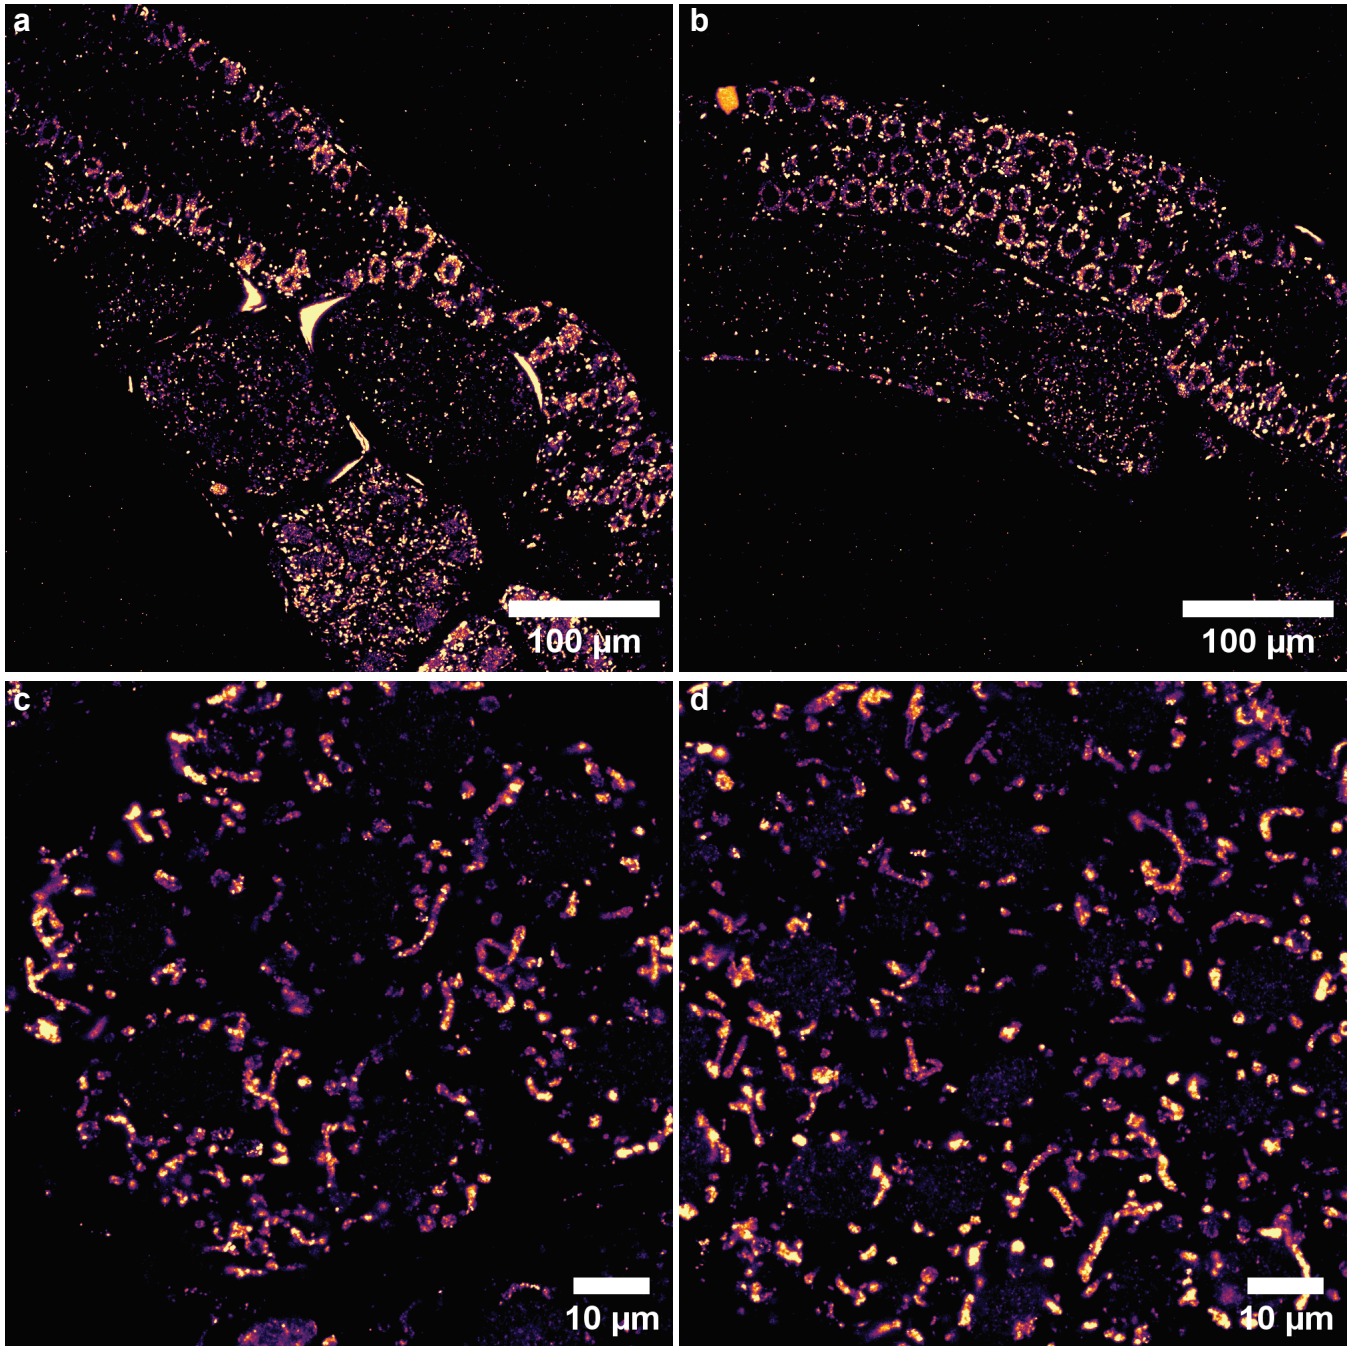

Figure 1. Expansion microscopy of *C. elegans* with mitochondrial labeling.

Cryo-expanded *C. elegans* hermaphrodites immunolabeled for ATP synthase subunit beta (ATP β ; Abcam ab14730) as a mitochondrial marker, imaged by NSPARC confocal microscopy with a Plan Apo IR 60x WI DIC N2 objective (NA 1.27). (a, b) Low-magnification views showing the full width of expanded worms, with tissue diameter exceeding 200 μ m following approximately 4-fold expansion. (c, d) High-magnification views of embryos within the uterus, revealing individual tubular mitochondria. Scale bars represent physical distances in the expanded sample and have not been corrected for the expansion factor ($\sim$ 4x).
