Research: "Electronic Record for Continuity of Patient Care: A use case for Doctor's handovers in hospitals."

Dear health professional,

The duty shift is a mechanism used to ensure the continuity of the care provided in the hospital environment, constituting a fundamental activity for the organization of work and the transmission of information among the professionals who perform the exchange of the work period. It is being developed by a team of specialists from the Faculty of Medicine of the Federal University of Minas Gerais (UFMG) in partnership with the Management of Teaching and Research and the Management of Processes and Information Technology department of the UFMG / Ebserh Hospital das Clínicas, with the aim of establishing best practices and electronically registering this process.

The paper proposes to study patterns of information for health data exchange and to develop a solution that assists the health professional, especially the on-callers, in the shift from hospital to hospital, evaluating the impact of the implementation of the electronic registry for continuity of care. The development of an official institutional tool for transferring patient care between shift shifts aims to reduce the risk of loss of essential information for medical decision-making, thereby improving the quality of clinical care provided and ensuring greater patient safety.

It is hoped that in the future relevant information about the care to be provided by health professionals such as doctors and nurses can be transferred electronically through the application to support evidence-based conduct.

You are being invited to participate in this survey because you are considered an expert in your field of expertise. This participation is voluntary and may be interrupted by you at any time. A researcher will observe the communication practices and information that make up the transfer of care between teams during on-call duty. The total time of the shift session will be measured by a stopwatch. The passages on duty will be recorded by the researchers and the information transcribed later, maintaining the secrecy in all the steps. Paper documents used by the doctors involved in the shift will be used for study purposes.

Later we will introduce a computerized instrument to support the communication between the teams during this transfer of care. Indicators of information quality and patient safety will be gauged before and after the implementation period of the computerization of the process of transfer of care.

Andsteja aware that all information collected will become confidential and will be kept under secrecy, ensuring that the data obtained during observations will be used only for this study. During the observation period, there is a risk that you may feel inhibited in your freedom of expression. To minimize this feeling, the researcher will be silent and will not give any opinion. We also inform you that there will be no financial burden or even compensation due to your participation in this study.

The participant and the researcher will sign two equal paths, one way with the participant and the other with the researcher. COEP-UFMG should be contacted in case of doubts about the ethical aspects of the research.

*I, _____, date of birth:
_____ and gender: _____, ID card:
_____, I Agree to **voluntarily** participate in the study.*

Belo Horizonte, _____ from _____ 20__.
