Project Description:

- Animal Model: N/A – In Vitro Experiment using Mouse Cells
- Animal Age: 8-13 Weeks
- Animal Sex: Male
- Animal Strain: C57B6/J
- Number: 5 Mice
- Groups:
 - Fibroblasts Cultured Alone
 - With and Without 100ng/mL LPS Stimulation
 - Bone marrow derived macrophages alone
 - With and Without 100ng/mL LPS Stimulation
 - Bone Marrow Derived Macrophages co-cultured with Fibroblasts
 - With and Without 100ng/mL LPS Stimulation
 - Bone Marrow Derived Macrophages Cultured on Transwell plate with Fibroblasts on Bottom Plate
 - With and Without 100ng/mL LPS Stimulation
 - Peritoneal Macrophages alone
 - With and Without 100ng/mL LPS Stimulation
 - Peritoneal Macrophages co-cultured with Fibroblasts
 - With and Without 100ng/mL LPS Stimulation
 - Peritoneal Macrophages cultured on Transwell Plate with Fibroblasts on Bottom Plate
 - With and Without 100ng/mL LPS Stimulation
- Experimental Conditions: Peritoneal fibroblasts, bone marrow derived macrophages, and peritoneal macrophages were all harvested from B6 mice. Fibroblasts were plated at 20,000 cells/well in AMCF media. After 24 hours, macrophages were plated at 30,000 cells/well either alone, on top of fibroblasts, or with transwell in BMDM media. 24-hours later, media removed and replaced with AMCF containing 100 ng/mL LPS. Cells were harvested after 16 hours and examined via qPCR.
