

The emerging role of next-generation sequencing in minimal residual disease assessment in acute lymphoblastic leukemia: a systematic review of current literature

1. Background

2. Objective

- ✓ evaluation of clinical utility and prognostic value of NGS for MRD detection in ALL vs MFC and qRT-PCR
- ✓ provide a comprehensive analysis of recent studies

3. Methods

Inclusion criteria:

- ✓ Diagnostic - ALL
- ✓ MRD evaluation - NGS
- ✓ Minimum patients – 10
- ✓ Language – English

PubMed® + Web of Science™

4. Results

= 13 papers

NGS

- good correlation with outcome
- predicted relapse
- better sensitivity

5. Discussions

- NGS improves prognostic accuracy
- standardization and cost remain challenges

ALL- acute lymphoblastic leukemia
MFC- multiparametric flow cytometry
qRT-PCR- real-time quantitative PCR
