Social Relations on Internet:

Social Isolation by the Internet:

Introduction:

Have you ever experienced meeting a person somewhere, where he or she kept attached to his smartphone while you were speaking to him or her? Did anyone hit you while gazing at his device? Did your friend tag you a Facebook post at 4:00 AM, or invite you to a live stream? There are a bunch of questions you may ask yourself about things you noticed. For example, why my colleague became isolated, having new weird opinions, or his behaviors are unjustified? I am sorry to tell you that these people were shifted by the Internet to live online instead of living real life.

Dear reader, it was noted that these means do prevent some people from real and direct contact with people, and confine them to their room. Some researchers have indicated in this matter that integration in the virtual world may cause fear of confrontation and coexistence with the real community, as well as the constant preoccupation with reading updates on communication. This means Social work may reduce the efficiency and productivity of employees and workers within agencies, and this is very dangerous.

We know that the process of social communication, due to modern technology in general, and our information technology in particular, has become one of the main means of communication that have changed the course of communication, making it easy to obtain information in an organized and rapid manner through computers and personal phones around the clock. Social networking sites like Facebook - Twitter - Whatsapp – LinkedIn, and many others, have emerged to become at the forefront of the information revolution without a competitor, as the information network has linked people to each other around the world to make the world a small village if this technology includes a huge amount of information in all Healthy walks of life - social - economic - political - business, banking, games, means of entertainment, acquaintance, marriage, and others.

The communication sites were characterized by ease of use and speed of spread. Any individual can indulge for very long periods and navigate his pages easily without feeling how much time has

passed, and this indicates the widespread use of social networking sites and their consideration of a distinct feature of this age, as communication methods are used by children, adolescents, adults and the elderly, i.e. all age groups of members of society. And also all layers of society with limited income and people with high incomes, so social networking sites have invaded all areas of social life as a means of communication and exchange of ideas and information as well as political, economic, and educational fields.

Despite the great benefit that social networking sites may achieve in all areas of life, but it is at the same time It may pose a danger to its users as there is an ongoing debate about the extent to which social networking sites contribute to the decline in family and social relations, and many researchers have indicated that spending most of his time in front of computer screens and phones would change the form of human relationships that bind individuals between them, Many people associate with the screen, whether it is a mobile phone or a computer, for a long time, because it provides him with entertainment, shopping, excitement, and exchange messages watching movies, playing, reading books, learning, and what is left of the individual's time is almost limited to sleeping and eating, which may also be limited to fast food while the eyes are fixed on the screens.

The uses of social media networks such as Facebook, Twitter, and YouTube, which allow communication with friends and colleagues and strengthen ties, are witnessing an increasing demand and a great demand from the various segments of society for what they achieve from social interaction that refers to the cognitive, emotional, emotional, and behavioral processes that take place between the connected parties so that these parties exchange many messages as Between them in a specific social situation in time and place, and the behavior of each party is a warning to the behavior of the other party. Instant conversations between them and global statistics show an increasing demand for using social networks in all parts of the world.

Excessive use of social media has multiple psychological and social repercussions, including increased anxiety, depression, a desire for isolation, and the inability to communicate realistically with

others. The study authors, through observations and follow-up of programs on the media, noted that this phenomenon is increasing its prevalence day after day, as well as its negative effects. Especially on the youth group, who are the most users of it for matters related to whether they are studying, work, or spending free time. It is also noticeable that the young man who uses social networks a lot is affected by his social communication skills and a sense of loneliness, which are among the most important that the individual possesses of various skills as it enables him to interact With others in a positive and effective way that enables him to reconcile and achieve social adaptation, the research team found that the number of Arab studies that dealt with this phenomenon is considered insufficient, which called for conducting this study to shed light on this phenomenon in our society and verify the motives of using social networks and its impact on social communication skills and loneliness feelings.

Many things are found in my book. Strongly, I recommed to read it.

The Problem of Social Isolation in the Time of Social Communication:

The matter is not history, not long ago we knew very little about these recent discoveries, which have changed the direction of social life since its appearance. The contemporary life that the present generations lead opens the door to questions about how people spent their free time before the dawn of social media, social networks, and the era of Speed and digital media.

People around the world are satisfied with the superficial information provided by social media, and of course, the view of the academic, researcher and even the journalist differs from the view of ordinary people about what social media offers of great benefits, and what can result from its multiple uses of damages to the norms and morals of societies, especially our societies Those dealing with these methods may be unaware of their dangers.

So, we are living in the modern digital communications revolution, thanks to which life and the world around us have become an electronic home, we roam freely in its rooms that challenge our ability to live on the back of the planet in a different way that was never available to the generation of our fathers, that revolution is a shared legacy for all humanity, but this does not negate this. It is a cultural achievement produced by creative and ingenious minds.

Social media and social media have benefits that cannot be dispensed with in any case and have damages that cannot be overlooked, as they allow the exchange of life experiences in various areas of life, gaining important knowledge and information from various sources that achieve the purposes of rapid and inexpensive social communication with friends and relatives close They are far away from us for different circumstances, whether for work, study, or other reasons, in addition to gaining creative experiences in various cultural fields, and providing appropriate knowledge and awareness of what is going on around humans in terms of events and developments in the virtual and real-world, so it is a good opportunity to acquire multiple skills in life and in different fields.

Of course, not everything that results from interacting with Social Media is pure evil, but there are negative aspects to its uses in reality, as it provides unlimited space to identify everything that could lead to moral corruption and destruction in the behavior of young people with the content, it broadcasts, and there is another aspect which is isolation. The feeling of real society and integration with the virtual community represented by friendship groups in chat rooms on the Internet in front of all the various values and cultures acceptable and unacceptable to them, to the extent that homes have become deserted despite the presence of all family members in them, but everyone lives in his own room with his virtual world also, you visit some social places to meet with family or friends to find silence haunting the place despite the presence of everyone in it, so that we started to chat with each other through social media despite our presence together in the same place, and we are not separated by a distance that hinders our direct conversation in person.

We have become living in social isolation in the time of social communication, many hours of the day we spend in front of smartphone screens exchanging information and sharing links to websites that publish variously scientific, educational, literary, and other content and we spend other hours responding to messages, reading them, and sending them back via the media to a different world, so it flies loaded with texts and images through space to its final destination.

On the other side of the most exciting and interesting scene, there is a relationship between social media sites and creativity in its many aspects, as it opens the door wide and provides invaluable opportunities to gain fame and money by displaying various talents, such as singing, for example, or advertising for products and consumer goods, in addition to their ability to provide opportunities Great for small business product marketing.

Also, some sites have a serious role in disintegrating societies and creating instability, by promoting some strange and anomalous behaviors of our conservative societies, extremist discourses, ideas, and rumors, which leads to their fragmentation and damage to their social fabric.

Here we never deny that social networks are great civilized achievements that allow their users, of course, to exchange information, stories, and community communication, but they lose us the ability to communicate in a real way. We are the most human generation communicating with us thanks to these sites, but these networks are not without real and visible damage and may continue to think and worry for many years to come about the possibility of limiting their damages and risks to our societies. The rapid rise of social media in recent years and its change to the usual lifestyle completely, and its effective impact on family and human relationships and the daily life of the individual, has become a real fact that should not be neglected.

What Makes the Internet Attractive?

Everybody wants faster internet and as we all remember what was life before the World Wide Web, a few numbers of us are able to envision the future without it. The capacity to look for answers to a critical question or speak with people from over the globe would be entirely difficult to surrender. Regardless of how particular a portion of the proposals is, the theories clarify that the Internet is transforming ourselves to improve things.

The big difference between the internet connections and ones kept up by other existing innovations (phones, mail, faxes) is that the new social estimations of Internet virtual networks have as accepted practices ones that take into account, and even energize, contact with relative outsiders. One may think the Net a virus place, but it need not be. In the unoriginal detachment of our enormous urban areas, where individuals regularly live isolated from family or desolate in the midst of the hordes, the Net can turn into a substitute public activity an imperative wellspring of relational contact notwithstanding its non-physical nature.

Since the internet doesn't offer a way to notice other non-verbal reactions to one's communications, a few oblivious, firmly held assumptions regarding interchanges conventions are challenged.

As opposed to being needed to support a solitary discussion with at least one individual or more. In the online environment, much the same as some other social circumstance, the essential factor is human consideration. In the public gatherings, we speak with an

audience that may have upwards of a few hundred individuals included - regardless if they don't all offer remarks.

Web correspondence expands the scope of conceivable informal networks that an individual can interface with, and includes components of variety that are engaging a few. There is a hyper-individual viewpoint to Internet correspondences, an approach to be more particular about how one presents one's self. The sorts of contrasts between individuals that may repress relationship development are covered up. This advances a feeling of gathering participation, one that is exclusively reliant on the impression of the beneficiary. Command over impression development is enhanced in composed mediums.

The ascribes of Web correspondences that stand apart as offering the potential for fulfilling, animating enthusiastic contribution's incorporate; it's the straightforward entry and 24-hour accessibility, the wide scope of various individual associations conceivable, the hyperpersonal idea of relational connections, the capacity to observe others cooperating (with no danger) and the uninhibited idea of no danger relating.

It is sensible to expect that numerous individuals will discover at least one of these elements sufficiently fortifying to get energetic about their Internet interaction, at any rate for the underlying timeframe when they are as yet finding the abilities of new Internet social associations. These variables are fundamental, yet not adequate, to clarify genuine pathologic PC use. Some extra characteristics intrinsic in the client must be available that separate those for whom Internet interchanges are an energetic past-time from those for whom this movement turns into an impulse bringing about a misfortune. The energy conceivable is reasonable, as virtual network contributions disintegrate geographic limits and extend the capacity of individuals with normal interests to share thoughts imperative to them. Nonetheless, the idea of compulsion is to keep on pursuing the underlying fervor one got, at the danger of other social contributions and duties.

The Online Populations:

Web usage overall realities all around the globe, the web keeps on changing how we interface with others, sort out the progression of

things, and offer data. With its developing impact on singular customers and enormous economies the same, the web has become an undeniably indispensable aspect of our everyday lives. In 2019, the number of web clients overall remained at 4.13 billion, which implies that the greater part of the worldwide population is presently associated with the World Wide Web. However, while the computerized populace is noticeably filling in numerous pieces of the world, web access and accessibility can vary essentially relying upon the district.

In July 2020, the Internet World States estimated about 4,8 billion people of 7,7 are Internet users. Practically, 50% of the total world's population, would be online before the year's over. Around 2 billion would be from developing countries. In the other hand, some countries are moving toward 100% of Web usage.

Features of Social Media:

Social media is a group of websites and applications that provide their users to communicate with each other through it. and social media allows all people to create private accounts that give them the ability to create and share content through it. this content is represented in videos, photos, group games, and written texts as well as providing an opportunity for others to interact with this content.

Basically, The Internet has introduced an interchanges upheaval or essentially quickened the progressions presented by the message, phone, radio, motion pictures, and TV. Undeniably, the Internet provided a substance with attributes that are totally novel and particular from past strategies for communication.

The Internet is basically a decentralized, self-maintained telecommunications organization. It is consists of connecting little networks from all around the world. This is a word that perceives that the interrelationships made by the Internet exist outside regular geographic limits and involve a solitary interconnected group of information, possibly adding up to a solitary assemblage of information. The Internet is available in basically all spots on Earth where access can be acquired either by wire association or by remote (counting satellite) joins. Viably, the main limitation on admittance to the Internet is the ownership of the methods for tying down the association with a broadcast communications framework and ownership of the fundamental equipment.

The software, which is utilized to get to the (internet browser), had been put straightforward; thus, it tends to be easily learned, utilized, and developed. Internet network access has direct connections of association with other media. For instance, News and other magazines, distributing houses have broadened their business with the assistance of Internet services.

Clearly, Interaction via the Web is flexible. It encourages communication through all kinds of contents, text, voice, and video as well. These products can profit at both institutional and individual levels.

The Internet is an immense communications service that comprises of large scale spread of computerized networks sent, processed, and imparted data. A "content supplier" transfers their information, for the most part of the Internet, or an application to a host server. The data is then sent to a PC or a portable. Communication through the Internet is momentary, consistent, intelligent, obtuse, borderless, and broad. Such categories interchanges may itself make a more serious danger.

Due to the various types of Web communication, a client of the Internet may talk or listen reciprocally obscuring the differentiation among "speakers" and "audience members" on the Internet. Talk rooms, email, and newsgroups are intuitive types of correspondence giving the client the open door both to talk and to listen. Accessibility is another category of the Web that makes it different from ordinary print or broadcast media. The low cost of using the Internet opens the door for everyone to practice.

Web-users don't need to uncover their actual characters to send messages or post messages on Internet websites. Clients can convey and make such postings namelessly or under nicknames. This component combined both with the capacity to get to the Internet in the security of one's own home or office, and the intelligent, responsive nature of communications on the Web, has brought about clients being far less restrained about the substance of their messages.

The web is an unforgiving medium because it effectively accessible repository of all things put on the web. In the event that data was posted on the Internet five, ten, or fifteen years back it tends to be recovered simultaneously as a thing that was posted on the Internet five minutes prior.

There are some websites that enable users to communicate instantly by text, voice, and video messages. Hence, social media helped people to constantly and continuously communicate at anytime and anywhere. Let us have a look at the properties of social media.

Social Media Properties:

Social media has some properties that give it a unique and distinctive characteristics and these features are as follows:

1- It provides users with advertising services, which advertisers offer in exchange for specific amounts of money between the two parties.

2- Many of these sites work completely for free; as it enables users to share and interact with content without any financial compensation.

3- In the interest of social media to satisfy users, it relies on highly intelligent software, which helps them to reach friends with similar characteristics; as well as accessing content that falls within their interests.

4- These methods depend on their work on collecting information about all users, and the activities they carry out through it; So that you know their interests, which helps them achieve their goals of ads and content.

5- The communication sites are characterized by great diversity, some of them are specialized in almost all fields, such as Facebook, and there are other sites that specialize in one type of content, such as YouTube that specializes in videos, and LinkedIn for business and employment.

So, social networks share basic characteristics while they are distinguished from each other by features imposed by the nature of the network and its users, the most prominent of which are:

Personal Files or Personal Pages:

Through personal files, the person's name can be identified, and basic information about him, such as gender, date of birth, interests, personal photos ... in addition to other information, and the profile is the entry portal to the person's world. Through the profile home page, the person's recent activity can be seen. And knowing who his friends are and what new pictures he has put up ... and other activities.

Participation:

Social media encourages contributions and reactions from interested people, as it blurs the line between the media and the audience

Openness:

Most of the media on social media sites provide open services for feedback and participation, or creation and modification of pages as

they encourage voting, comments, and information exchange, but there are rarely any barriers to accessing and benefiting from the content.

Conversation:

Where social networking sites and social media are distinguished from traditional ones by allowing for two-way conversation, that is, participation and interaction with the event, news, or information presented.

Friends / connections:

They are the same as people whom a person identifies with for a specific purpose. Social sites call the person added to the friend list, while some professional social sites call “contact” the name of the person added to the list.

Send messages:

This feature allows you to send direct messages to a person, whether or not he is on the friend list.

Photo Albums:

Social networks allow its users to create an infinite number of albums and upload hundreds of pictures to them, and to share these photos with friends to review and comment on them.

Community:

Social media allows local communities to quickly form their own sites and communicate effectively, and then those societies in the whole world are linked around common interests or interests such as a love of photography, a political issue, or a favorite TV program, and the world really becomes a small village containing a converged electronic community.

Groups:

Many social sites allow the feature to create an interest group, where a group can be created with a specific name and specific goals. The social site provides the owner of the group and its joiners with a square that looks like a mini dialogue forum and a miniature photo album. It also allows the feature to coordinate meetings through what is known as "events" Or events and invite members of that group to him and determine the number of those present and absent

Connectedness:

Social networking sites are characterized by being a social network interconnected with each other, through the links and links provided by the pages of those sites that link you to other social networking sites as well, such as a news story on a blog that you like, so it sends you to your acquaintances on Facebook, and thus facilitates and accelerates the transmission of information

Pages:

Facebook invented this idea, and used it commercially in an effective way, as it is currently working on creating targeted media campaigns that allow owners of commercial products or events to direct their pages and show them to a group of users they specify, and Facebook deducts an amount for each click reached from Before any user who clicked on the advertisement, the idea of pages is based on creating a page in which information about the product, personality or event is placed, and then users browse those pages through specific divisions, and then if they find interest in that page, they add it to their profile.

Motives for Using the Internet:

There are several motives that make an individual move from the real world to the virtual world and create at least one account for him on one of the social networking sites, and among the most important factors that push various individuals, especially young people, to participate in these sites are the following:

Family Problems:

The family forms a protective shield for the individual as it provides him with security, protection, stability, and reference, but in the event that the individual lacks this integrated environment, he has a kind of social disorder that makes him search for an alternative to compensate for the deprivation that may appear, for example, in the absence of the role of parents or one of them due to life concerns or family disintegration.

Leisure:

The void that results from mismanagement of time or its proper use of it that makes the individual not feel its value and looking for a way to occupy this time is among the social networking sites, as the number of endless applications that Facebook produces, for example, for its users and the sharing of each group of friends with pictures and audio files makes Facebook In particular, social networks, in general, are one of the means to fill the void and thus become a means of entertainment and a waste of time for some of them.

The Unemployment:

It is considered about the process of discontinuation and lack of professional integration that leads to support for social and psychological integration and from it to social exclusion, which is the result of the accumulation of obstacles and the gradual interruption of social relations, and it is one of the most important social problems that the individual suffers from and that pushes him to create solutions to get out of this situation in which he lives even if

these solutions are Hypothetical, there are those who make him unemployed and its continuity a person who is indignant about the society in which he lives, as he did not provide him with an opportunity to work and express his capabilities and ideologies, such as linking relationships with virtual people for the sake of fraud and fraud.

Curiosity:

Social networking sites constitute a virtual world full of innovative ideas and technologies that appeal to the individual to experiment and use, whether in his scientific, practical, or personal life. Social networking sites are based on the idea of attraction, and if there is a binary of attraction and curiosity, the matter will be achieved.

Dating and Making Friends:

Social networking sites have facilitated the formation of friendships, as these networks combine real friendships with virtual friendships, as they provide an opportunity to link relationships with individuals from the same community or from other societies that are different between the sexes or between members of the same sex.

Marketing or Job Searching:

In fact, social networking sites are no longer just for the sake of acquaintance, but rather have become a powerful and very effective marketing tool for business owners, being low in costs, and ensuring easy communication with them inside and outside the workplace, in addition to the ease of joining and subscribing to them.

It also has the ability to design and develop, classify subscribers according to age, gender, interests and hobbies, ease of linking business with customers, and also link employers with applicants

Work and the Spread of Information and Its Exploitation:

The experience of network marketing increases communication with consumers and with competencies, as it has become among the means to search for jobs and career development opportunities and exchange experiences.

Competencies as In the LinkedIn Network:

Through a presentation of the most important factors that drive individuals to participate in social networks, we find that there are those who use them for the motivation of learning, expanding knowledge and personal and life skills, discussing community issues,

expressing opinions freely, and breathing for oneself ..., in addition to a set of reasons that have not We can list them all.

The Use of Emoji:

Emoji is an art that consists of various glyphs that express feelings and objects. It is a new Language without letters. This term was launched from Japan a few years ago to be used by the whole world as if it was a new global language that millions of people are spoken with every day. Because in this age of speed, there is no time to meditate or think. This is how we can easily imagine the continuing suffering of the new generation. Emoji are a godsend for them; No confusion or suffering after today.

Starting in 2012, when Apple first adopted these icons in the iPhone, "iOS 5", and most companies of phones and smart tablets followed suit later, the public caught them with less enthusiasm, sometimes described as emoji fever. Some statistics indicate that most of the population in developed countries use these symbols, especially the millennial generation among them.

In order to understand the spread of this phenomenon, it must be noted that any writer, no matter how long he is in the language and its grammar, or humble, must sometimes feel confused or upset when choosing the appropriate words to express his feelings or describe the things he writes about. How is the condition of those who lack any expertise or experience in writing, and suffer from the poverty of their vocabulary? As is the case with most of those who communicate on websites?

Simple, colorful graphics known as "Emoji" took their place to become one of the languages of communication between individuals through the Internet and communication and social networking sites, as millions around the world use them. Users of these applications that came out of Japan and spread to the world.

It is not sufficient to send a symbol or group of symbols within the context of the message so that the receiving party fully understands the content of the message, and these symbols include different forms from sad and expressive symbols to smiles, feelings, and smileys,

As a result of the intensive use and widespread use of emoji among users of all ages, 2015 was undoubtedly the year of emoji, in

which a lot of events occurred in terms of emoji. Its biggest move was in the same year through social networks, the most powerful of which, of course, is the Facebook platform, which launched six 6 interactive emoji in a more dynamic way that appears directly below the comment box.

Some believe that the use of emoji is a natural development of communication between humans since ancient times and is considered a kind of revolutionary art, such as drawing on the walls of caves, communicating with smoke, and other forms of communication that have ceased to exist and others that have evolved until we reached where we are now.

Some linguists strongly warn that addiction to emoji communication may lead in the future to a severe failure to communicate with each other naturally.

There are those who use them to escape from continuing to talk, and another tries to hide his weakness in front of the person who is talking with him, and psychologists warn of the danger of excessive use of these symbols or their addiction, because of their negative effects on social communication, as they lack direct confrontation and speaking openly, as well as It pushes people to become withdrawn and reduces their effectiveness in communicating and attracting words to others.

Colorful emoji have dominated the patterns of people interacting with each other in recent times. These symbols replaced words and letters and became more capable of expression and interaction. Often times we find that these symbols are a better way to express or express what we want to say rather than using words.

If you are sad or happy, for example, you do not need to write and express your feelings in excess. It is enough just to send a sad or happy face through any means of social communication. How did these "emoji" change the way we interact with others? How did it become a basic means of expressing what is going on inside us?

Emoji is not just an image or even an expression of a word, but an indication of the emotional state that you are experiencing while you are talking with someone you do not see, the alternative to your body language, facial expressions, and the intensity of your voice

during your speech, which gives more information that gives the language.

In fact, "emoji" is a repository of the secrets of souls. Your choice of symbols reveals a lot about your personality, your cultural background, your language, and the country to which you belong, but your choice of emoji may be distorted in the context of another culture if you are not careful in selecting your expressive symbols that exceed language barriers, It may deviate from its chosen course in light of cultural and religious tensions around the world, and the world's suffering from terrorism and sympathizers with its symbols everywhere.

Misinterpretation and misunderstanding of your symbols in the context of another culture will not spare you in light of the security restrictions in countries such as America and Europe. Especially for those who are on scholarship in America and Europe, where the people of the country are tried on criminal charges as a result of their use of expressive symbols as a matter of humor or humor in their messages to their friends or followers.

Suddenly, a new soft language launched by the revolution in the field of social media networks and sites invaded the world, and it brought people together without the differences of nationalities, ethnicities and languages. It is a language that does not need the rules of alphabets. Many consider it a project of the future that brings the world together within global development. On the other hand, few see it as returning humanity to the language of symbols. Between this view and that, emoji develops as a language that achieves international communication with an area of billions of letters per day with its symbols that express the feeling of its writer and sometimes what words may fail to do.

In terms of not knowing the world overwhelmed with developments in informatics and digital and the world of cyber and its inventions, additions and successive applications that infiltrated our smartphones and cafes (our Facebook pages) and our books, but rather into our homes and souls an emoji language coming from Japan and bearing many features of the awareness and shape of that people.

A quiet storm of change that spread and is still spreading randomly, but it may settle within a decade or more on agreed final codes. When I say emoji, readers who do not deal with the digital and cyber world will stop at the word and wonder what it means. It is similar to the Japanese names they used to hear in animated films coming from Japan.

This unspoken question leads us to the history of emoji that actually appeared in Japan at the hands of an engineer named Shigitaka Kurita, a specialist in television communications in the 1990s. The first emoji he launched was that small circular face topped with the famous yellow smile, which remains to this day the most popular and widely used vocabulary of this language.

The Most Commonly Used Language:

At first, Shigitaka - the founder of emoji - was unable to market his invention to refuse to manage the project in which he is working to use the symbol for fear of confusion in its circulation, especially since the Japanese laws related to etiquette, courtesy, and speech are very accurate and very complex. But the real broad launch of the emoji language came from Apple in 2011 when the company launched a number of them on its applications.

In 2015, the Oxford English Dictionary adopted the word emoji as "the face whose eyes tear with joy" as the most common word on the planet. It has been estimated that 6 billion emojis are traded daily, circulating around the world. However, some have raised concerns that the widespread use of emoji will weaken other languages, and will allow young people in particular to use simple symbols that do not matter how much they understand the deep implications of expressing simple daily feelings that they feel as they use smartphone applications, WhatsApp programs, and social networks.

Experts pointed out that emoji language helps convey the message in a faster way, but the downside is that it weakens the language because it encourages the user to communicate through an image.

Many believe that the extent of the spread achieved by the English language since knowledge and digital applications swept the world, made it impose itself as the language of this world. Today, this spread faces a great challenge emanating from the smartphones of

juveniles, adolescents, and even children around the world, as they exchange simple messages expressed in pictures and without letters, instead of text messages that swept the world with the advent of the mobile phone, and which led the monopoly of communication companies to impose fees for sending them, which reduced its use in relation to modern applications for smartphones.

The user may not know a language other than his mother tongue, but he is able to communicate to a certain extent with a second user in another country who does not know his language through the use of symbols, but without a doubt, there remains limited communication and remains vulnerable to a misunderstanding between the two communicators through the interpretation of the meaning of the image that is used. . In my opinion, emoji breaks the language barrier between different countries and different peoples.

What is striking is the growing number of emojis and their symbols and the movement of animation entering each other, which makes one wonder where would this language stand, which does not require letters, rules, punctuation, writing, rhetoric, or creation? The emoji site, "Emoji Pedia", which specializes in emoji, revealed that as of June 2017, the number of emoji registered on the Unicode scale was 2,666.

Some specialists attribute the revolution in the mass-circulation of emoji to the phenomenon of diarrhea that appeals to adolescents and youth to evade real knowledge, and they see in this context that its excessive circulation will return the world to the era before written languages, to the age of symbolic languages, cuneiform, hieroglyphic, Chinese and Japanese, which are prepared by scholars Linguistics are primitive languages compared to letter languages that represent the height of the human mind.

As a matter of fact, 6 billion emoji are exchanged daily on live chat programs around the world considered, Our age is witnessing a return to direct communication methods - face to face due to the requirements of digital reality, like those dealing with computers are satisfied with writing to each other - although this is decreasing due to the spread of the possibilities of exchanging films and co-filming in several programs and applications (programs such as Musikli add language Body to the world of communications by mixing Instagram

add-ons and singing sound effects into small videos that enrich and deepen face-to-face communication) ”.

the experts added, "Emoji affects our minds, so when we watch someone write and receive emoji with teary eyes, we discover from his facial features that he is actually interacting with the image by smiling, for example, as if he met another person face to face." We are, in fact, going back to primitive symbols with a little globalization. Emoji overrun the means of communication (WhatsApp, Viber, Skype, Tango) and social communication (Facebook, Instagram, Twitter) in such a sweeping way, it is necessary for all linguists and linguists to warn that the world is on the verge of a huge leap of knowledge that may be like the emergence of languages. The ancient religious history books attribute it to the Tower of Babel, where the nations were dispersed.

We have to pay attention to a very important element here, as all the commonly used methods of emoji are free, which means another war on traditional means of communication. This is a war on ancient languages, a war without loudness, shouting, or blood, but with laughter, image, color, and symbolism, all of which quickly displace parts of the language that man hardly learns.

Yes, this language is not suitable for writing a thesis for an academic study, it is not suitable for poetry, it is not suitable for novels, and it may not even be suitable for writing a personal message. The future may witness the growth of this language, in the event of expected development.

By placing symbols close to each other, sentences can be shortened, but in my opinion, it is difficult to write an article with these pictures, because they may cause an error in communicating the idea to the reader, so it is difficult for the pictures to express multiple meanings as it happens in the use of words.

Today's emoji send simple short pictorial sentences to express specific meanings. But emoji may not be suitable for that now, in this section of history, in the second decade of the twenty-first century, but no one can predict how the situation will turn out in 3 decades, less or more.

The First Move to Internet Addiction:

Loneliness feelings is the individual's sense of losing interest in anything. The dissatisfaction resulting from the frustration of their natural needs, as a result of the loss of communication with others or a glimpse of the community. This makes them desperate, and many suicide attempts of different ages result from feeling lonely, or in response to loss Love, or feeling unwanted, or useless.

It is also the individual's sense of the existence of a psychological gap separating them from the people and subjects of their psychological field to the point where they feels a lack of acceptance, friendship, and love on the part of others. So that this results in the individual being deprived of the capacity to engage in fruitful and fulfilling relationships with any of the persons and subjects of the environment in where they live, and practices role through it

It can also be presented as an emotionally charged experience as a result of failure or frustration of the individual's social relationships and is largely consistent. Others define feeling lonely as an extremely unpleasant experience linked to a need for mutual human intimacy.

Internet addiction disorder (IAD) otherwise called hazardous web use or neurotic web use is commonly characterized as dangerous, habitual utilization of the web that outcomes in huge weakness in a person's capacity in different life spaces over a long time. Youngsters are one of the gatherings at specific danger of creating Internet Addiction Disorder or Problematic Internet Use.

This and other different relationships between advanced media use and psychological wellness have been under serious examination, discussion, and conversation among specialists in a few teaches, and have produced debate from the clinical, logical, and mechanical networks. Such problems can be analyzed when an individual participates in online exercises at the expense of satisfying everyday obligations or seeking after different interests, and without respect for the negative outcomes. The Internet can encourage different addictions including dependence on erotic entertainment,

game-playing, closeout locales, person to person communication destinations, and surfing of the Web.

Communication addiction disorder (CAD) is a supposed social issue connected directly with the need of being in steady connected with others, in any event, when there is no functional need for such communication. CAD has been connected to Web addiction. Users become dependent on the social components of the Internet, for example, Facebook and Youtube. They become dependent on one-on-one or gathering interaction as social help, connections, and entertainment. This sort of habit is called risky web-based media use.

Social network addiction is a reliance of individuals by communicating, refreshing, and control of their and their companion's in social websites. For certain individuals, actually, the main significant thing is to have many friends in the groups no matter that they are disconnected or just virtual; this is especially valid for youngsters as a reinforcement of egos. The young people utilize social apps to show their admired picture to other people.

It is found that relational difficulties, for example, introversion, social matters, and people with poor face to face relational abilities, regularly lead to web addiction. Web-based connections offer a protected option for individuals with the previously mentioned troubles to escape from the expected communicational and problems regarding social contact.

People who need adequate social association and social help are found to run a higher danger of Web addiction. They resort to virtual connections and backing to lighten their loneliness. Actuality, the most wanted applications among Internet addicts are chat rooms, intuitive games, texting, or web-based media.

Internet and Social Isolation:

In light of this tremendous and continuous technological development in communications, isolation has spread among members of the same family, while they are inside one house, so everyone may be sitting in one room, but each of them is isolated from the other in his hands, a mobile through which he talks with another person or plays a game of famous games This created a state of "autism" for all family members.

Recently, we started talking about the dangerous role that computers play in socially isolated individuals and dissolving relationships between individuals in society. Individuals spend a lot of time dealing with computers and the Internet, which leads to isolation from others during the period of use which in turn will spread a kind of isolation. Socialism and thus creating a kind of social deconstruction, just as the spread of the Internet will spread new patterns of values and behaviors in the whole society. Perhaps it is important to point out, starting with the results of the study that was conducted on family disintegration. The results showed that 30% of all families suffer from family problems despite their different types. These problems are considered a time bomb that will explode at any time, while another study conducted by the National Center for Social and Criminal Research in Egypt, for example, indicated that 5.37% of families suffer from family problems.

Among the most important of these problems are the delinquency of children, domestic violence in all its forms, the absence of a role model, marital disputes that often end in separation and other problems, the increase in family disintegration in both quantitative and qualitative terms within society reflects, in fact, a tense social climate that multiplies. There are economic and social pressures, and this shift is due to the winds of Westernization that are almost striking the stability and privacy of third world's families, in addition to the new openness to the world through satellite channels, the Internet, and modern media.

Computer Introversion:

Psychology has now become what is called computer introversion, and this condition exists when a person continues to sit in front of the computer for long hours every day in a manner similar to gambling addicts. Of course with the exception of people whose work requires this, and this condition may exist in isolationist individuals with introverted personalities or persons those who wish to escape from their conditions and life problems. They would resort to the computer to empty their energy and worries in it, in addition to the stress and psychological tension that results from using the computer for long periods.

The phenomenon of chat rooms that has become prevalent in an almost satisfactory manner that leads to an imbalance in emotions and directing feelings in other than their destination. Natural, which leads families to other deviant relationships, but that does not mean condemning computers completely, but rather a call to rationalize its use and not to overuse it in a way that poses a threat to our security and psychological safety in the long run.

Emotional Void:

If computers and access to the Internet and chat rooms are an expression of a brilliant scientific and technological cry, then in its other face it is an expression of an emotional, psychological and emotional void in societies, especially in this materialistic age that lacks spirituality. Our strong interest in computer rooms and chatting via the Internet expresses the absence of family control and escaping from direct and clear social relations to relationships governed by secrecy. This is surrounded by secrecy and with apparently safe consequences, but it may lead in the end to dangerous pitfalls and ruin his life and future.

A Social Catastrophe:

Controversy erupted recently about the negative impact of chat rooms on the relationship between spouses within the family, due to the flight of husbands and wives. It happens, especially during disputes between them, to the search for a new type of relationship via the Internet, and these relationships are more like a stroke of luck. It comes out of it with a new and beneficial relationship on the social level, or with a heavy loss when it collides with those who are looking for illegal relationships on the Internet. Thus the possibility of something unfortunate happening, and this is what prompted us to try to search in this matter and enter this virtual world in order to reach the reality of this serious issue and its implications for such families.

Between Reality and Imagination:

One of the wrong things that many people fall into during their interaction with chat rooms over the Internet is that they do not distinguish between social relationships through these conversations and the real world or between the virtual world and the real world. We do and say things through the virtual world that we neither do nor

do we say it in the real world, and we must understand that the Internet is a real-world, and ignoring this leads to trouble.

When the user makes a conversation on the Internet, he does it with real people who have real feelings, so the user of the Internet has to treat people with the same respect that he treats them face to face, or in while talking to them on the phone, despite this, there are some differences. When an Internet user talks to a person directly and faces to face, we see well the facial movements and body language, including movement and voice, especially since these signals constitute 60 percent of human communication. Conversation via the Internet is done in secret, and this means that 60 percent of the communication is lost and it is body language, and therefore the user is only talking about 40 percent, and this is what causes misunderstanding on the Internet.

The Breakdown of Social Relations:

Chat rooms undoubtedly affect the relationships within the family and society, especially marital relations. Chat rooms and the Internet, in general, are the place where a person can speak with himself and with others frankly to say what he cannot say in direct contact. The danger of that is that Marital relations are facing severe coolness due to the husband heading towards chat rooms and preferring to talk to her over sitting with his wife and talking to her, and it is really strange that the Internet and chat rooms have caused a new type of divorce known as emotional divorce and this type of divorce occurs when he sits The man is on the Internet at night and replies to e-mails, which ultimately leads to a state of electronic addiction and the unwillingness to talk to his wife. This ultimately leads to an emotional separation between the spouses, and the husband may even travel to the girls he speaks to on the Internet to see them in nature, which leads to the fluctuation of the relationship between the spouses and its eventual collapse.

False Breakdown:

It is worth noting that the latest studies confirmed that modern electronic media have a significant negative impact on the intimate relationships between spouses. This leads to a kind of drought and dulled feelings and thus to the increase of problems and the disintegration of the marital relationship, and the search for the

cause of these problems on the arousal model confirms The electronic services provided by the chat and the Internet, which are specially designed to entertain and satisfy human hobbies. On the same level, a recent study confirmed that a large percentage of husbands lost the desire to communicate with their wives after they were impressed with models of women through online chatting sites.

Pathological Symptoms:

Regarding the negative effects on human health as a result of his long sitting in front of the computer, we confirm that the highest percentage of harm to the users was in the back pain and the mother came in the neck second, then the shrouding, then the hands, and then the arms, while the least injuries were inflicted on the feet. Doctors treating the affected cases that they sought to diagnose cases include cervical and lumbar slippage, muscle strain of the vertebrae, herniated disc, dampness, and cold in the bone due to exposure to high air conditioning, severe fatigue due to long work periods, disease-related symptoms.

In general, the conversation over the Internet (chatting) gives the person the opportunity to talk about things that he cannot say directly due to the fake hobbies that the Internet user uses. Therefore the other parties cannot identify their real personality and they do not know in the end except their nickname, and of course for this mystery another positive side is a negative. The positive side is that people talk about something they are ashamed of in-person or even when talking on the phone, which is what made a large number of introverted people become daring personalities on the Internet, contrary to reality.

From here the socially unsuccessful people became able to repeat communication with the outside world through the use of the Internet, there are many people who are characterized by self-introversion open their feelings through the Internet, which appears in social isolation and lack of positive contact with the outside world, and this type of people reaped a number of benefits through the global Internet. The negative of this ambiguity is that some of them take advantage of the inability to reveal their true hobbies in order to talk to people who use profanity. Rude, so a chat room user has to

be careful in believing everything he or she receives via this conversation.

Obsessed Then Hooked in the Internet:

The present Internet is both a blessing and a curse. It offers access to data much more than in the past. Individuals talk about getting sucked down the rabbit hole when what we intend to stay only a couple of moments online effectively transforms into 60 minutes or more. Sometimes the issue is clear, for example, spending long periods on video gaming or other entertainment fields.

The web provides simple access to momentary rewards, which, from the logical point of view, takes care of directly into components that support this issue. These rewards hit directly the delight focus area in the brain. In spite of the fact that to be very specific, it is the anticipation of prize that achieves the greatest release. Knowing this, it begins appearing well and good how every new page has a kind of lure for us. As a result of that, our brains start looking for something new.

The mind enacts its prize community as a way to get away from pressure and tension. Indeed, this is the core of the problem of addiction. On top of the regular stress and anxiety of modern life, people with specific mental and movement disorders can easily become overwhelmed, leading to more stress and anxiety. On the opposite end of the spectrum, these people have an innate aversion to boredom, which can also register as stress and anxiety in the brain. In the two cases, setting off to the web offers what is proposed to be a concise break.

Because of this sophisticated nature, a few researchers don't give definitions of the Internet addiction problem. Various terms are utilized to depict similar symptoms of unlimited Internet use. Web addiction problem is utilized reciprocally with risky Internet use, pathological Internet use, and Internet addictive disorder. At times, this behavior is likewise alluded to as Internet abuse, dangerous computer use, impulsive Internet use, Internet misuse, destructive use of the Internet, and Internet dependency.

There are a lot of studies and books bringing up the numerous ways technology is harming the way in which we carry on with our lives. We're less associated with our children, we're attached to our screens, and we're worn out. Consistently around this time, you read another composition about somebody who has taken a long break from the web just to get some harmony, calm, and viewpoint. Some of us are not quite prepared for whatever serious and looking helplessly for a change.

Clearly, the capacity to eliminate ourselves from online interruptions is a benefit. Many of us are online for work, to interface with family we don't see in any case, to associate in manners we don't in the reality.

Any website that permits clients to transfer text, sound, or video would need to execute a channel that checks for copyrighted material. This is ostensibly a commendable objective, yet one that harms a significant part of the real web.

Internet addiction is considered a pathological condition that means the inability to dissociate from a certain thing. So, this thing is outside the limits and will of the person, and in this era, many people are exposed to addiction problems. Perhaps the most prominent of which is Internet addiction, which means the length of time a person spends using the Internet with different goals and objectives. This condition is completely satisfactory and abnormal, and the great technological development in our time has led to an increase in the demand for the use of the Internet from various devices, whether portable or through smartphones and others.

Causes of Internet Addiction:

- * Feeling bored.
- * The emptiness and the length of hours in which a person does not find anything useful to occupy his time with it.
- * Feeling lonely and isolated.
- * The privileges that the Internet provides to its user, where he can find various things that he likes or is new to him.

Symptoms of Internet Addiction:

- * The long hours that a person spends using the Internet in a manner that exceeds what a person limits himself to.

- * Feeling of distress, suffocation, and tension in the event of the inability to connect to the Internet.

- * The feeling of great and overwhelming happiness in the event that the Internet returns to work after it has been interrupted, especially for long periods.

- * Talking about the Internet, its services and advantages, all hours of the day, and including it in most daily conversations.

- * Abandonment from performing various social duties, whether on the family or job level, to allocate time to use the Internet.

- * Use the Internet normally even in the presence of social and family problems.

- * Use the Internet as soon as you wake up to see messages, new events, pictures, and various comments.

- * The inability to face and solve life's problems and pressures.

- * Feeling shy, withdrawn, and aloof from people.

- * Emotions mixed between joy and guilt.

The consequences of Internet addiction are that the person remains alone, does not know anything about reality, and is completely separated from it. In addition to health problems such as back pain, neck pain, and eyes. The failure of different social relationships and marriage in the forefront. Bad morals, corruption, and tampering with them due to the knowledge of cultures and civilizations that are alien to the person and different from his upbringing, customs, and culture. Treatment of Internet Addiction Seeking serious help from responsible and experienced people before the situation worsens and the problem worsens further. Obtaining the support and encouragement of family, friends, and relatives who are interested in the person's welfare. Avoid accessing the Internet through cell phones to reduce the hours of Internet use, due to the use of the Internet at this time through phones. Determine certain hours for using the Internet.

Controlled by Smartphones:

Those who remain fearful of losing their smartphones, or being outside the network's coverage area of signal and WiFi, meaning they are unable to communicate with others. It is an obsession that afflicted the world and destroyed the human ability to develop solutions to the forced suffering of the mobiles.

With a little thought, there are people who feel and cheer by owning the latest devices and smartphones to enjoy its modern programs, addition to the many features offered by these devices. It is normal when a person uses a mobile phone to make calls or talk to friends and relatives from time to time or download a game in which he is competing with his friends. But what if the use of the smartphone turns into an addiction? Do you see what problems this addiction can cause to its owner? In addition, surveys and studies on the smartphone have warned of increasing signs of addiction, and studies have concluded that people stare at smartphones screens for approximately 3 hours a day or more, in addition to the time they spend making calls.

Furthermore, it was noted that psychiatrists were the ones who took the initiative to consider combating the phenomenon, in order to recognize that smartphone addiction is a psychological disorder. Experts warn that using new technologies at an early age may double the risk of addiction, isolation, and school failure.

Whereas, the smartphone is no longer a means of communicating with others only, but rather the smartphone has become used to terminate and follow up private work as it is used in the field of studying and entertaining oneself through games or watching movies and listening to songs and communication sites such as Facebook, Twitter, and other programs. According to the newspaper The Daily Mail British people check their cell phones 34 times a day, and eighty-five-eight-one percent of people keep their phones close to them, and sixty-three 63 percent check their phones even during sleep.

People who feel fear of losing their mobile phone or being outside the network's coverage area, and then lack of communication suffer

from sleep disease, as monophobia can be monitored through calling or receiving devices, the ability to do a set of actions. For example, that a person checks his mobile phone more than 30 once a day, or simply feels that it is impossible for him to dispense with his phone and live without it. The number is growing more and more around the world, and if they are removed from their phones they feel stressed. Experts have found that smartphone addicts are angry, and may take actions beyond their control.

Also, the frequent use of a smartphone leads to a lack of cognitive skills, especially among students, as the surveys have shown that the degree of smartphone addiction increases among young people, as one in 5 young people checks his phone once every few minutes. The researchers drew attention to all this inspection. For phones, it comes at the cost of neglecting the world around us, and causes increased anxiety, tension, and distraction.

A study conducted by "Hi-Tech" showed that nearly 1.5 billion people around the world own mobile phones, while the study revealed that if this upward development has revolutionized the world of communications, then it certainly has had a prominent impact on behaviors of individuals in many communities. The study revealed that the use of smart mobile phones with an Internet connection causes "addiction" to this technology, and this situation is widespread and widespread, among the 6.8 billion inhabitants of the earth, 1.5 billion people own mobile phones.

But far from numbers and comparisons, the widespread use of mobile phones, especially smartphones, has led to a fundamental change in societal behavior. According to the study, 60% of mobile phone users sleep with their devices by their hands, and 15% of them may stop their entertainment and emotional conversations just to respond to the mobile phone. Indeed, just as when playing a video game continuously, it can be considered an addiction form.

Researchers found two causes of smartphone addiction:

1. A recent global study showed that 60% of women around the world cannot do without their smartphones, while they consider their smart devices to be their most important possessions, compared to 43% of men who also confirmed their inability to disengage from their smart devices. A recent study showed that women are more

connected and addicted to their smartphones than men. Women find the mobile phone a vital way to pass the time that she suffers from long and monotonous, especially for the housewife. In addition to being preoccupied with life's troubles and not being able to communicate with family and friends permanently, which makes programs and smartphone applications an easy way to help you communicate permanently with others.

2. The researchers say that smartphone addicts, especially those addicted to using social media networks and programs find in it an "alternative reality". As the person resorts to finding an alternative reality to his lived reality that is not good for him or her in most times and does not reflect his or her aspirations. All that he needs to change his reality is to create a personal account on a social site, thus creating a new world of his own. In addition, he or she intends to redraw his or her image in the way they wants, which is naturally different from the real image that is not satisfactory to them.

The new fictitious personality that these sites allow him the ability to represent, and a large number of friends that they provide to him from all over the world. All these temptations make the person unable to escape from this virtual world that cares a lot about them.

Signs of Smartphone Addiction:

Smartphone addiction means addiction to its applications, games, and social networks at the same time. One of the most obvious symptoms that appear in smartphone addicts.

1. Feeling very anxious and upset when the phone is forgotten, separated from it, or forced to switch it off.

2. Looking at the phone from time to time and losing it permanently, even without the need to make a call, send a message, or check the Internet. Researchers have recorded numbers saying that smartphone addicts check their phones more than 300 times a day.

3. Feeling happy when using a mobile phone or even just by looking at it, as if it were the person's closest friend.

4. Isolation from family and friends, failure, and decreased effectiveness at work and study.

5. On the health level, people addicted to smartphones suffer from neck pain due to the poor posture in which they sit for long

hours while using the phone.

6. Feeling very sad, and it may reach the point of illness or depression when taking the mobile phone from him, so that parents may have to admit him to the hospital to receive appropriate treatment for his condition.

7. The presence of the smartphone with its owner everywhere, as you find it placing it next to him and checking it while he is at the dining table, on transportation, in the restaurant, at work, at school, while he is driving a car, and nothing prevents him from looking at the phone from time to time.

Phone Addiction Pushes Isolation From Society:

Communication via the phone and the Internet has become a part of most people's daily life. Despite their good advantages, experts warn against addiction and the marginalization of actual contact with people in the real world, so as not to turn into silent societies.

Many young people have become addicted to using cell phones and surfing the Internet, as they communicate with the virtual world, at the expense of the real world. With the passage of time, an increasing number of elderly people are following the example of young people, and they are now communicating with outer space with their phones or emails, instead of direct face-to-face dialogue. Although the smartphone and the Internet facilitate communication with friends and relatives, experts warn of the consequences of using it on the unity of society, according to the German "Science" magazine, which published a summary of the study.

An expert emphasized that direct communication with the outside world is more effective and faster in sick people, compared to patients who only communicate via phones and the Internet. The experts also explained that children who grow up in families that use computers and smartphones to a large degree have their social balance vulnerable to imbalance. Other experts are trying to develop applications for computer games that scan automatically when people meet with each other, to open the way for direct conversation, instead of marginalizing the other and focusing on playing, as stated in the "Science" magazine.

For many children and adults alike, computer games have become a substitute for friends, and lead to social isolation. Experts advise setting a period of time for playing and also set times for surfing the Internet so that this does not affect the person's participation in real life with other people.

A recent American study revealed that the use of cell phones may lead to the user isolating themselves from the practice of social activities and becoming more selfish, despite the fact that the cell phone is basically a means of strengthening social bonds between people.

These results came from scientific research published under the name of "The Effect of Mobile Phone Use." included many groups of university students, who were at least twenty years old, and the researchers found that these young people under study refused to participate in public service and volunteer work after a short period of using cell phones, unlike people who were not connected to the cell phone and agreed to do that. The volunteer work and a number of mobile phone users refused to answer some questions that they knew answered and refused to do so. Selfishness and ignorance of others reached their limits when they showed no interest when the researchers asked them to draw simple pictures of their cell phones and briefly explain how to use them.

The study authors explain these results, noting that the constant use of mobile phones kills the need for communication for some people, satisfies the human need for containment by others, and reduces his desire to communicate or practice any social activity or behavior with people. The study defined social behavior as the benefit provided by a person to another person or society as a whole, and therefore when a person uses the phone.

Nomophobia:

No-Mobile-phone phobia (Nomophobia) is the feeling of fear of losing a mobile phone or being outside the range of network coverage, and hence the inability to make or receive communications, which is more common among young people.

The results of multiple studies indicate that this phobia is becoming more prevalent. According to 2019 research, nearly 53 percent of Britons who owned a phone in 2008 felt anxious when

they did not have their phone, the phone battery was dead or had no service.

In another study conducted in 2017 on 145 first-year medical students in India, research results indicated that 17.9 percent of the participants had mild phobias, while 60 percent of the participants had moderate symptoms, and 22.1 percent of the symptoms were severe. There have not been any scientific studies on the statistics of the United States, there are some experts expect that these numbers may be higher, especially among teenagers.

Symptoms of Nomophobia:

Affective Symptoms Include:

You worry, fear, or panic when you think about not owning your phone or not being able to use it

You feel excited and uncomfortable if you have to put on your phone or know that you will not be able to use it for a while

You panic if you can't find your phone for a while

Feeling of pressure when you are unable to check your phone

As for the physical symptoms, they include the following:

Tightness in your chest or difficulty breathing, increased sweating, feeling faint, dizzy or disoriented, and a fast heartbeat.

Causes of Nomophobia:

Nomophobia is a modern phobia, in other words, it likely stems from increased reliance on technology and anxiety about what might happen if you suddenly cannot access the required information, and also if your phone is the primary means of contacting the people you care about, then you are more likely to feel lonely without it. And the unwillingness to experience this feeling keeps your phone close at all times.

Another reason may be fear of inaccessibility, as we all keep our phones close if we are waiting for an important message or call, but this may become a habit that is difficult to break.

Nomophobia may not yet be classified as an official state of mental health, yet experts agree that this issue from the era of technology is a growing concern that could affect mental health.

If you use your phone regularly, you may experience a brief moment of panic when you realize that you do not have it or cannot find it, this does not mean that you have a phobia, but if you worry a lot about the absence of your phone or not being able to use it, you cannot focus on what you need. Need to be done, consider contacting a therapist for help.

Dominated By Social Media:

The main idea of social networks is to collect the data of the members participating in the site, and this data is publicly published so that the members with common interests and who are looking for files or pictures meet ... etc. Old friends were also able to communicate with each other, and after many years, they were also able to visual and audio communication, exchange pictures and other possibilities that strengthen the social relationship between them.

Social networking sites are also known as a system of electronic networks via the Internet that allows the subscriber to create a private pages and websites on it and then link it through an electronic social system with other members who have the same interests and hobbies.

Social networking sites in a simplified way is a process that helps individuals communicate with a large number of people (relatives, colleagues, researchers' friends, ...) through electronic sites and services that provide fast information delivery, exchange of opinions and ideas, comment on them, and exchange congratulations at public and private events on a wide range. These sites are not only give you information, but also synchronize and interact with you while providing you with that information within the scope of your network and thus be a method for exchanging information instantly through the Internet.

They are defined as the websites on which Internet applications provide services. For its users, it allows them to create a personal page displayed to the public within a specific site or system. It provides a means of communication with the knowledge of the page creator or with other users of the system, and provides services for exchanging information between users of that site or system via the Internet.

Social networking sites have become a great thing. In recent years, it has managed to reunite users and gather them under their umbrellas, after they were lost in forums and between scattered sites. Previously, forums were the only place that allowed the user to

express his opinion and come out in the form of letters and words and were providing a simple means of communication between human beings scattered around the globe. But after the emergence of social networks, it managed in a short time to attract a large number of users, and these sites became the main browsing destination for many users and favorite sites to spend their time on the Internet.

The question here is how a site like Facebook managed to exceed a billion users, and what are the main features or characteristics that attract users to this site and to other networking sites, and regardless of the advertising campaigns carried out by these networks in order to attract more users, except That there are main and common characteristics among these sites that contributed to their fame and widespread.

Now, four basic characteristics that are common to all social networks will be shown. These characteristics are the basic features that distinguish social networking sites from any other site, through which you can judge any site whether it is a real social network or A normal site that offers some social features.

Four Main Characteristics of Any Social Network:

1) Users Create The Content:

The content may have more than one image, it is textual content in many networks, and it is also graphic content as in Flickr, which is audio content as in Sound Cloud, and it is also in the form of video as in YouTube, those social networks specialize in the quality of Certain forms of content, but of course, this does not prevent the existence of other forms of content.

The content in social networks is made by the users themselves, not by the developers or the owners of the social network, the owner of the social network cannot add the content to the network except as a user. So when someone builds a new social network, it is initially empty of content, it must attract users who will participate in the creation of content within the site. The developer must provide the necessary tools and the appropriate atmosphere in order to motivate users to contribute to the creation and building of content within the network.

This feature is one of the main characteristics that differentiate between social networks (along with participatory sites such as forums) and other sites such as blogs and news sites in which the responsibility for adding content is for management, as for the user. What the user must do is receive and read, or contribute to the promotion of the content (through comments. for example).

2) Profiles:

The profile is the page that represents the individuals or organization within the social network. All users must have a personal page that represents them. This personal page will be relied upon when creating content and building relationships within the network. The system that manages the social network does not know who it is. The person who sits behind the computer screen and does not deal with him, but deals with the personal page, this page is the mediator between the network and the user, so the user can write and interact with others and communicate with them through this (profile).

Every part of the content within the social network must be linked to a personal page (Profile), it is the one that is relied upon in any interaction that the user performs within the network such as requesting friendships, comments, evaluations, etc. So users find that social networks motivate them. It always asks you to register in order to create your own personal page, otherwise, you will not be able to interact in any way or add content to the network, you will only be able to read and the viewing feature may be blocked even (or part of it) until you create a page Your own personality within the network.

3) Relationships between Users:

This feature depends on the previous characteristics because relationships are between personal profiles (Profiles) and not between real people. The personal page may be somewhat expressive of your personality and yourself, but it may also be far from your true personality. Therefore the relationships that are built within the network Social are relationships between personal pages (Profiles) and not between real individuals. These personal pages may express individuals and they may be fake pages or contrary to reality.

Any social network must provide any form of creating relationships between users. These relationships are not useless, as there are many social characteristics associated with and dependent on them, the most important of which is the delivery of content from one user to another. Relationships in communication networks determine which content will be displayed on the main pages of each user. But in general, there are two main types of relationships within social networks:

First: One-sided relationship: so that some social characteristics are available for one of the two parties without the other (for example, the posts of the second user are displayed on the page of the first user and vice versa). An example of this type is the follow-up feature on Twitter.

Second, Reciprocal relationship: which is the provision of some social characteristics to both users (for example displaying the posts of the first user on the page of the second user and vice versa) and an example of this type is the (friendship) feature on Facebook.

4) User-Changed Content:

Suppose you are sitting next to your friend, and both of you open the Facebook site, will you find the content that appeared to you is the same as the content that appeared to your friend? Of course not, this is what distinguishes social networks in a prominent way from the rest of the sites. That depends on participation, on Facebook, Twitter, and other networks: each user appears for him different content from the other, content dedicated to himself, this depends mostly on the relationships between users because it is known that the content is shaped by the posts of friends and the pages that the user follows.

This last feature is not present in forums, for example, forums naturally have the first and second properties. The forum can be developed to provide the third feature by allowing the possibility of adding friends even in a simple and primitive way. But the forums, in the end, do not provide the fourth property, because all users see the same content when they enter the main page of the forum (there may be parts that only appear for those who have the appropriate authority), but in social networks, the content varies from user to

user. If the forums provided this fourth feature, we could call it a social network.

Years ago, YouTube was a regular site for sharing and publishing videos, but it has recently become a social network because it provided the previous basic features, especially the fourth feature that was recently developed. We are now watching videos from the channels that you are subscribed to on the home page, each user views other videos on his home page based on his subscriptions.

So, how can you have a life that you want to, keeping away from the interruptions and controls of others? To do as such, you have to know how you work. "Know thyself", the Ancients encouraged. Unfortunately, we are frequently bad at this.

The extreme use of the Web and social media has been linked with behavioral addiction, which stimulated the experts' interest in knowing a better knowledge of this worldwide phenomenon. The experts found that addiction to the Internet and social media has fewer differences than similarities. Because of this, social media addiction and Internet addiction were found to be powerfully and significantly connected. It is important to note that the differences between both of the technology addictions recognized suggestions that not entirely addictive online behaviors are similar. The main contribution to social media addiction and internet addiction are not detached concepts. The link between social media addiction and internet addiction indicates that both of them are very similar.

In any case, conversely, others realize us progressively well. Our intelligence, and significantly from our "likes" on Facebook machines that containing and using information from our advanced impression, are preferable appointed authorities of our character over our loved ones. Before long, man-made consciousness, utilizing our informal community information, will know considerably more. The 21st-century challenge will be the means by which to live when others realize us better than we know ourselves.

However, how free would we say we are today? There are enterprises devoted to catching and selling our consideration—and the best snare is interpersonal interaction. Facebook, Instagram, and Twitter, and other social application networks have brought us nearer to the fire hole. However, they make us pay the costs, both individual

and political. Users must choose if the advantages of these benefits exceed their expenses.

This choice ought to be openly made. But can it be, if social networking sites are possibly addictive? The choice ought to likewise be informed. It could happen if we do not realize what's going on in the background?

Social networking websites snatch us since they get to self-relevant data and bear on our societal position and reputation. The more prominent your need to have a place and be mainstream and the more grounded your cerebrum's prize habitats react to your notoriety being upgraded, the more overpowering is the site's alarm. For example, a few analysts would strongly claim that Facebook addiction "has become a reality".

People undertake numerous exercises on Facebook, from gaming to long-range social communication. The expression "Facebook addiction" consequently needs clarification. Likewise, as Facebook is only one of many social networks, the expression "social networking addiction" would appear to be more suitable.

However, the expression "addiction" itself remains conceivably tricky. Addictions are normally thought of as constant conditions that mess up our lives. For sure, marking unnecessary associations in a movement as a "compulsion" could bring about the overpathologisation of ordinary practices.

Social media networks have become the greatest driver of the behaviors of many of us, and indeed our daily activities and the most influencing factor in it which has reached the point of addiction. As the term addiction has become common and associated with the use of social networks and the person's dependence on them. Indeed, the centers concerned with the study of human societies and behaviors are interested in providing treatment for this new type of behavioral addiction, as it directly affects the structure of society and the cohesion of the family.

The addiction to social networks is described as the extreme and frequent excessive and compulsive need to use social networks without the presence of professional or academic necessities. Therefore, the individual is preoccupied with them, and they cannot

refrain from them or stop using them the thing that means, using them in a way that affects their daily life in a harmful way.

Hence, treatment has become a goal and goal that preoccupies many families and societies in different countries of the world, especially the persistence of this addictive behavior over a long period of time that hinders the ability of societies to develop.

Advantages of Using Internet:

We cannot deny that the interface (the Internet) and all the applications connected to it, including social networks, have their advantages, especially as they facilitated communication between individuals in many situations that required a person to move from place to place, and among these advantages:

- Allow everyone to express their opinion and make their voices heard by the concerned parties.
- Managing discussions remotely (discussion groups).
- Breaking down geographical, regional, and cultural barriers in communication, dialogue, and interaction with others.
- Selecting and following up on specialized media and periodicals all over the world.
- Distance learning.
- Get any information at any time.
- Carrying out all economic activities.
- Doing medical imaging and surgery.
- The existence of electronic evidence.

If a person uses all these capabilities. However, addictive behavior may manifest its symptoms through not normal use, but with excessive use, which shows the negative aspects of social networks on the other side.

Effects of a Person's Addiction to Social Networks:

There are many negative effects of an addictive person's use of social networks.

The First Is The Physical Effects:

- Obesity due to the frequent sitting in front of modern screens, whether from telephones or computers, to hold discussions or respond to messages. More about obesity and its various causes.

- Spinal injuries sitting for similarly long periods.
- Ear or hearing injuries if the person uses earphones for long periods.
- Fatigue to the eye to sit for hours in front of the screens that emit radiation.
- Hand pains due to frequent use of the keyboard or carrying the mobile phone in reading mode for long periods of time to write and respond to messages.

Secondly, the Social and Psychological Effects:

- Imposing isolation on oneself and withdrawal from social life.
- The absence and weakness of supervision over children, due to the difficulty of sitting and watching them all the time through the screens they use.
- Quarrels with friends and family members frequently for being absent from them for long periods of time.
- Breakdown with the family.
- The absence of the language of dialogue with the other and imposing one's opinion.

More about the Culture of Dialogue:

- Being influenced by the cultures of others that lack parental control.
- Widespread anxiety and nervousness.
- Exhaustion, lack of psychological calm, and not taking breaks required for a person every day.

Treatment for Social Media Addiction:

The causes of social media addiction usually include the behavior of addicts of self-control when using the thing addicted to it, and the feeling of several symptoms as a result of discontinuation from this thing, including anxiety and a strong desire to return to it. So the person addicted to social media is characterized by the inability to stop you browse these sites all day for a number of reasons. The following is a presentation of some of them:

- FOMO: (Fear Of Missing Out), and it means fear of missing out, which is a great motivation for using the social network, especially for those under the age of thirty years.
- Ego: Some people need a platform to present themselves, and social networks are the best option for that, as 80% of online

conversations are found to be full of self-disclosing information.

- Brain chemistry: Where a study from Harvard University showed that talking about oneself online moves the same area of the brain that is affected by the consumption of an addictive substance, such as cocaine.

- Verifying the social acceptance of the individual: by obtaining acceptance or approval from peers. Recent studies have also shown that social media use is associated with feelings of social isolation, depression, insecurity, jealousy, and poor self-esteem.

Signs of social media addiction to find out if a person is addicted to social networking sites, any person must have some signs that indicate this, and here are some of them:

- Spend more than an hour a day on social media.
- Browse social media whenever possible.
- Over-sharing on these sites.
- Affected by the individual's professional, academic, or social performance.
- The presence of psychological withdrawal symptoms when trying to reduce the time you surf on social media.
- Resorting to social media to avoid problems that occur in real life.
- Browse social media when sleeping, which causes insomnia.

Effects of social media addiction to social media causes negative effects on individuals' lives, whether physical or mental, and the following is an explanation of these symptoms:

- Physical effects: Carpal tunnel syndrome is a problem that occurs in the hands or wrists due to a lot of writing.

- Squeezing the tendons of the fingers due to typing on the phone.

- Eye strain due to staring at the screen for too long.

Psychological and mental effects:

- Low self-esteem.
- Generating feelings of envy when looking at the seemingly perfect lives of others on social media.
- Not wanting to have real social interactions if one thing can be said to hundreds of people with one click.

- The mind is preoccupied with matters that are not beneficial instead of learning something new.

Gaming Addiction:

Electronic games have become the talk of the day in recent times. It significantly engages children, teens, and young adults; to spend their spare time. Electronic games are defined as the various electronics that make up interactive games, whether by using their own devices or using computers, or advanced cellular devices. Some people think that video games are the same as electronic games, but in reality, they are different. Video games are part of electronic games; rather, it is the most popular type of it, and electronic games include different games Such as sound games, ball games, pinball and slot machines.

Spending long times playing on the computer causes health damage to the body, as sitting for a continuous period in the same position, and pressing the same buttons repeatedly leads to fatigue of the hands and eyes, a feeling of physical fatigue, and difficulty sleeping, which negatively affects the activity of the individual And his performance at school or work.

Loss of time and energy: players spend a lot of time while playing, as many computer games require a large commitment of time to complete, which leads players to give up basic activities in their lives. To complete their preferred games and win in their different phases, there are competitions that require regular contribution from the competitor to escape losing them, which might cause addiction to some competitors, and waste great period that can be spent contributing a valuable hobby.

Game addiction causes aggressive behavior: Some people are affected by violent content contained in some electronic games, which may negatively affect players, so their behavior tends to be aggressive and violent in reality, or some may become frustrated and upset as a result of the violent and aggressive behavior they see on the screen a lot. Addiction to electronic games is a widespread phenomenon and is represented by a person's great attachment to electronic games and the inability to communicate with others, in addition to affecting the daily and normal activity and the occurrence

of a change in behaviors so that a person may dream of games during sleep.

Types of Electronic Games Addiction:

Online games addiction is classified into two categories:

1. Single-Task Electronic Games Addiction:

In it, there is one player, and upon achieving the required mission, the game ends, so this type of game is not addictive.

1. Multitasking Electronic Games Addiction:

Here the person plays with more than one player over the Internet and creates a fake character and gets to know players from all countries of the world, and there is no specific end to this game, so you find the person attached to it and always plays and here gets addictive.

Reasons for Addiction to Electronic Games:

The most important causes of electronic games addiction, which have been monitored according to practical and realistic studies and statistics, are:

First: The state of euphoria and the sense of power that a person feels in the electronic games space, which he lacks in reality.

Second: The success of electronic games in killing the state of physical and personal emptiness that many people may suffer from, especially in the teenage period.

Third: the unbridled desire to escape from the real world with its problems and worries to the world of fun games.

Fourth: the constant renewal and motivation that electronic games production companies master, in addition to the sense of team spirit and communication that a person experiences when playing electronic games.

Fifth: One of the most important causes of addiction to electronic games is the family's failure to communicate positively and effectively with their children and children.

Actually, there are many reasons why a person or teenager and even adults sometimes become addicted to electronic games, including:

- Parents' isolation and distance from communicating with children.

- Feeling of emptiness, which makes him resort to games to fill the void.

- Feeling happy and euphoric as a result of playing games and being psychologically accustomed to them.

- Desire to escape from reality and this usually occurs in adolescence as a result of social distancing from parents.

- Extreme professionalism in attracting young people to games and this is the marketing role of electronic games companies.

Symptoms of Electronic Games Addiction:

- The severity of attachment to electronic devices.
- Unwilling to be present and to communicate with others.
- Not wanting to leave the house.
- The person is stuck inside the games.
- Academic delay and neglect of studying.
- Find funds to go to video gym centers.
- Loss of appetite and weight loss.
- Severe nervousness and loss of focus.
- Psychological symptoms of electronic games addiction
- Feeling anxious and tense.
- Depression.
- Isolation and loneliness.
- Schizophrenia.

Damages of Electronic Games Addiction:

We cannot ignore the harms of addiction to electronic games, which represent a real danger to the youth who are the mainstay of the nation. The harms of addiction to electronic games are:

First: severe health effects:

- Low back pain and neck pain with severe weakness in the bladder muscles with severe muscle laziness and a constant feeling of chronic constipation Add to that a constant complaint of eye pain and poor eyesight.

Second: An academic delay and marked weakness in educational attainment.

Third: extreme tension and sleep disturbance with signs of depression.

Fourth: The high economic cost that the family may cost as a result of one of its members being addicted to electronic games.

Fifth: Acquiring negative behaviors such as violence and aggression. Specialized studies have proven that most teenage violence in the United States is mainly caused by addiction to electronic games.

From this standpoint, and after we explained the harms of electronic games addiction, we must refer to the treatment of electronic games addiction.

Online Aholic:

We are addicted to a wide range of things. Some to eat, some to drinking, medications, shopping, and to technology, the rundown of addictive practices continues endlessly. We are trying to claim ignorance and go to these things as an approach to veil such a large number of troublesome and undesirable occasions in our lives. At the point when we're focused on, we may eat to veil the pressure and cause ourselves to feel better incidentally, however, the impacts don't last, so we continue eating, yet all we've truly done is make ourselves fatter, adding new worry to our lives of being fat, and become dependent on eating.

We may go to drink or medications as an approach to lift the heaviness of the world away for some time, however, these as well, are brief escapes that quite often transform into addictions; this enslavement will in the end cause lasting organ harm or even demise of the dependent of a blameless observer. Strangely, numerous individuals are going to the web for a similar kind of alleviation.

With online media technologies, numerous individuals make personas that look somewhat like their actual characters and battles as an approach to get away from the hardships of the real world. They go through a long stretch of time dying on web-based games, web-based media, and other web contributions. Hopelessness, stubbornness, stress, fatigue, and uneasiness can be washed away through fanciful web-based gaming spaces and visit highlights, which replace genuine vis-à-vis discussions.

For a few, the web can deliver sentiments of elation. Truth be told, the unreasonable utilization of the web, web-based gaming, and web-based media has become a significant issue, and clinicians have now characterized Internet habit as the most up to date emotional well-being problem.

It's an intense issue in light of the fact that, for a few of us, PCs are a fundamental aspect of our lives and not regarding interpersonal interaction, but rather occupations as well. So a large number of us can go through hours before a PC at work at that point

return home and go through hours before our PC in the solace of our rooms. We are not entirely certain that such examples mean enslavement, particularly on the grounds that the explanations for those practices are distinctive relying upon setting might be grinding away, we are customizing or contributing information, however at home, we are messing around or just coolly perusing.

We think that web addiction is an extremely substantial issue that individuals face today. As dark as it might appear, a few people truly depend on the web in unfortunate manners to fulfill the requirements for stress alleviation and social connections. Be that as it may, as you referenced over, the pressure help is just brief, and when you log off your PC, dejection by and by starts to set in. It is a phony feeling of solace.

Clearly, this is a genuine compulsion since they are setting up recovery facilities here in America for individuals who have computer games and web options. A companion of mine once disclosed to me that a couple they knew had gotten a separation since one of the mates had a dependence on web-based gaming. It is a real sense that destroyed their marriage. So how might anybody say it's anything but a genuine issue?

That is to say, take a gander at this age for instance. We know for ourselves and numerous others that when we need to take a break from considering or doing schoolwork the principal thing we go to enjoy a psychological reprieve is signing on to Facebook. Which appears to be amusing in light of the fact that for a ton of us, examining or doing schoolwork includes utilizing a PC. In this way, rather than taking a break from our PC, we connect with it further by going on a person to person communication site.

Furthermore, it is truly insane to perceive how frequently individuals jump on Facebook during the day. I know for me, I am continually checking Facebook following class, while I am hanging tight for the light rail and other irregular occasions during the day. I wonder about myself, how did I deal with my time before I had a Facebook in 2009? Presently, Facebook is such a tremendous aspect of my life I can't envision regularly disposing of it. Furthermore, on the off chance that I am not on Facebook I am browsing measure or by email. That alarms me, in light of the fact

that since I am so dependent on it and could never need to dispose of it, I believe I also may have a dependence.

The psychologists have recently put Internet addiction as an emotional well-being issue. In any case, when we consider it, there's very some rationale to it. Web, dissimilar to ever previously, is currently accessible for use in any place individuals go. We can get it on our telephones, our iPads, their iPods, workstations, and so on, at the point when we consider how frequently for the duration of the day. Then, we will be conversing with a companion and the entirety of the unexpected other will pull out his telephone to check something on the Internet, it's pretty insane to think how it has become such a characteristic piece of regular daily life.

No doubt that Web addiction exists. Similarly, like addictions to many other things outside the domain of drugs and liquor exist caffeine addictions, practice addictions. These untraditional addictions are constantly addressed by public society.

False Self- Satisfaction on the Internet:

Social networking sites have turned into a means of satisfying desires, a false space for patients, and a space for polluting the environment of human awareness and spreading insignificance.

The use of Facebook and other social media networks has been expanding in the most recent decade, with a huge number of new clients going along with all on a quarterly premise around the world. This expanded use, yet, could be a double edged blade as informal communication destinations give their individuals utilitarian, social, and self-upgrading benefits, and yet, can deliver negative prosperity, work-life equalization, and work execution outcomes.

Basically, Facebook furnishes its individuals with the occasion to cooperate with various individuals, called "Facebook companions". Through these associations, clients, particularly those with low confidence and loser fulfillment can improve their mental prosperity. However, these compensating connections can prompt unnecessary utilization of such destinations, up to the degree of dependence, particularly for people with low confidence, low self-adequacy, and other "dangerous" attributes, and those with a solid requirement for idealism.

The overuse of such applications can likewise be related to other mental issues, past enslavement. The use of Facebook, and for sure maybe other web-based media destinations, can advance the false presentation introduction of oneself, which we attempt to be undesirable dependent on bogus self-hypotheses since it can eventually prompt decreased prosperity and advance different mental pathologies. In contrast to other online objections, for example, entrances, news sites, and even websites, where one can remark either secretly or under a phony name, long-range informal communication destinations require their clients to uncover themselves, as far as names, yet additionally regarding companions, exercises, pictures, sentiments, and inclinations. Apparently, and expecting judiciousness, these clients self-improve their actual

personality to coordinate an ideal one, yet would improbably make light of their actual character.

All things considered, we expand the possibility of the false self, and its resulting mental weaknesses to another area, to be specific Facebook, which gives an effective vehicle to creating and introducing a bogus self. The "Facebook-self" is normally an all the more socially worthy and well-known self, and thus, can be altogether different from the client's genuine or "genuine self."

The conditions that lead to the making of a bogus "Facebook-self" may vary starting with one client or circumstances then onto the next. For example, there is a motivation to anticipate that the distinction between the "genuine self" and the "Facebook-self" may be greater when an individual is not happy with their reality or have low confidence and thus establishes an elective climate to make up for their genuine lacks. The production of a bogus "Facebook-self" can likewise be a consequence of different individual contrasts in connection style and realness. We, therefore, build up a hypothesis which ties these ideas and clarifies the formation of the Facebook-self.

The negative impacts of Facebook use were basically found in the overuse cases, for example, decreased offline public activity investment, withdrawal from scholastic investigations challenges seeing someone, and a feeling of time-squandering and blame emotions. Similarly, it was discovered that some Facebook clients incline toward their social connection to be on the web.

These clients typically take part in person to person communication site use as a way to control their disposition changes. At the point when they have insufficient self-guideline capacities, they may participate in unreasonable and tricky Facebook use, which is some of the time named a dependence on the utilization of such destinations. From a mind initiation outlook, the hazardous utilization of Facebook is normally determined by the hyper-sharpened and hyperactive amygdala-striatal framework.

With the emergence of social networking sites, horizons opened for everyone to express what everyone wants after it was confined to websites and newspapers, these sites have revealed an electronic epidemic and opened a space for a few people with the disease of

fame to get out of their holes, it is an old disease but with the emergence of social networking sites, He found a more fertile ground to bring out these patients. This group claims culture and knowledge to search for fame, and they follow all twisted paths to reach it, regardless of these methods.

It is noticed that people are selecting the most sensitive topics in their society, as they know that the tongues will either support them or applaud or opposes. There is no doubt that bitter reality, wars, misery, poverty, and bad morals are preparations, as oppressed peoples have their morals bad as well as emptiness is a big reason for the emergence of this category.

In fact, if we go back together a little bit, we will find that this sick mentality was not born of the moment, for the one who is defeated is never fond of imitating the majority in his motto, his outfit, his suit, and all his conditions and returns, and the reason for that is that the soul never believes perfection in the one who conquers it. That is, just a fake copy without a soul is more like statues.

Social media addicts this category begins by expressing topics such as religion and sex in a quarrelsome and rude manner without knowledge, knowledge, or purpose to search for a solution to an issue that concerns society only because society is not used to it and when the first step begins by publishing an article, poetic text, or a picture, comments are thrown on it between supporters and opponents. The owner of the page looks at the interaction, the feeling of self-importance begins and he holds himself a great responsibility that may reach a belief in his role and his ability to influence and change, and he is dominated by a feeling that others are waiting for what he will say or publish, but he arrives with the text of an idea and a quarter of awareness that he imagines that he is turning the hands of time to make events and change the course of history On social media pages.

Fame has a spark that snatches the minds of many. Especially the hearts of adolescents, so their obsession became polishing themselves, and highlighting their narcissism not with something valuable, but with strange behaviors and ridiculous humor, and patterns of bragging about trips and diaries that do not present or delay them, nor those who watch them. So that it became a goal in

itself, not for fun, but to show the false pleasure in it, and to get followers and fame, and they strive for that, and they spend a lot of precious and precious for it. Even if their arrival at the ladder of fame required that they make themselves a laughing stock of the followers, there is no consideration for the method. Because the goal is precious to them until the ideal became the end justify the method, an approach competing for its principle. We find that they have given their time and their ideas to ascend the ladder of fame.

Thus, for many adolescents, fame has become an easy-to-attain quality, as it does not need knowledge and does not distinguish creation, not even culture. Because it is empty of content until it has become a pathological phenomenon, and a rapidly spreading social epidemic, they compete over it and boast a large number of followers, not the content of what they presented. Social media has become one of the most important tools for popularity. To document every moment and every event, directly. With the ability to interact with followers, and know their reactions to each event.

Until the interest in communication sites and programs reached the point that distracts them from important matters and their usual normal life So that their lives are attractive to followers, as much as they represent and artificially represent events and beautiful moments which led to the spread of this obsession and its impact on various aspects of life. Its occupation of many adolescents' thinking in particular. Hence the importance of paying attention to the seriousness of this phenomenon: To try to reduce them and correct their course; And to prevent our children from slipping behind it, and to follow the example of its owners by educating them and building their personality in an integrated manner, by linking them to role models of old or modern value, but with useful moral, religious or scientific values. And fill their vacancy with what is beneficial to them, and raise the ceiling of their interests by directing them to the interests that promote them in knowledge and values, while arranging their priorities in life, and taking care of their entertainment needs and taking care of them.

It is no longer sufficient for children to satisfy the basic needs of their parents, especially after entertainment became their priority. Therefore, it must be taken care of in terms of quantity and type and

directing its path so that empty entertainment and content do not consume their time by following what harms them and does not benefit them. Or he deviates from them to be without an identity, grabbing everything around them and being affected by it and imitating it. And that is by strengthening their self-confidence, to rise above the trivialities and margins of matters while satisfying their emotional needs, through the family. Their social needs through friends who belong to them, and satisfy the desire to belong and appreciate them; So that they do not get carried away by empty characters, from which they quote their behaviors and details of their lives. And also give them the attention and the appropriate status to satisfy their need to appear and to integrate their personalities, so they are not driven to show themselves in pitfalls far from values.

With the modification of the direction of their need for a natural appearance in adolescents, by strengthening their self-confidence in the direction of acquiring knowledge and preserving values, through the stories of those who God raised their destiny with knowledge, and those who were clothed by God the garment of dignity and love of people; To hold them high moral values. And clarify the consequences of fame on himself and his life. By drawing a clear picture for them in the comparison between the real and the false fame, with the clarification that people's respect and love is gained through the pleasure of God, and then the individual's respect for himself. Fame may be a field for some people to follow but at the same time a place for their mockery and belittling. Due to the absurdity of what is issued without having values or a goal. Respecting and preserving privacy: an important requirement for protection from tamperers who prey on mistakes and are quick to spread them. They also reach fame through it. It is sufficient for the children to learn to evaluate themselves; Let them perform it, they are the most knowledgeable of people about it and what comes from it and let them realize that they may have fabricated a false life for themselves and a deviant way to draw attention to them, so that they become in the eyes of themselves before the eyes of those who watched them as a young child stirring up riots to draw attention, and he realizes that he is straying from the right. What fame for underestimating and belittling oneself!

As much as social media platforms made it easier to communicate with family and friends: but at the same time, it facilitated social emergence, and provided the opportunity for those who do not have the elements of fame to be famous. Without possessing the slightest of its ingredients other than an obsessive appearance.

The ego begins to swell little by little until it reaches the explosion and the person with the disease begins to fabricate events, ideas, and pictures and gasps behind them to increase the appearance and gather the largest number of fans and followers even if it is at the expense of the dignity of others or their beliefs and sanctities and begins to harass everything to draw attention to a degree that all laws and everything just forgets. His tongue says what I show you except what I see. The search for fame has become a disease or a syndrome of fame if it is permissible for us to call it. This disease achieves for its owner self-satisfaction and euphoria in its place in society and it has finally become the talk of a lot.

Social media has turned into a means of satisfying desires, a false space for patients and parades, an area for polluting the environment of human consciousness and spreading insignificance. He has become like windmills of no use, while the topics that are carried by human issues, concerns, and aspirations, no one approaches or discusses, but despite the illusion that may leak into their minds that they are famous, the bitter truth that these people do not want to know is that fame is not based on creative and cognitive content is a case Temporary will fade into a mirage.

These sites do not establish a value that lasts except what I relate to the value itself, but what we have to know is that the state of emptiness and emptiness and the crisis of the unconscious is exacerbating and overwhelming the collective memory. All of these create idols in all areas and he is the one who gives them a false light space to appear, especially those who arise to respond to them under the name of response on suspicion, it increases their stardom, and if there was awareness, there would be no millimeter of space for these patients.

The problem is that some of the famous people, despite the superficiality of what they are famous for: they have become role

models for many of the younger generations, regardless of the quality of what they are known for or useful. It is no longer surprising that we see through communication programs a miserable diary that contains everything except for values and interest, starting with morning coffee, and extending until the last lamp in the house is turned off, in an integrated picture that clearly shows one thing, which is the amount of spiritual and psychological emptiness that the student of this type of Fame, as well as its followers despite the large number.

Delusional Digital Happiness:

Happiness, boredom, sadness, anger, panic ... all emotions expressed by many people on blogs, social networks, or through SMS services. Two Internet artists created a website to collect the feelings and feelings that are expressed on the World Wide Web. Every 10 minutes, a robot program searches for sentences containing at least one of the 5,000 emotions categorized into specific categories.

Every day, 15,000 to 20,000 new sentences containing a sentiment are found and stored in the site's database, the site's officials explained. The site's browser, which is only available in English, can identify the feelings of others in six different ways.

The first mode expresses the chaos of feelings and emotions through the appearance of colored dots, squares, and scraps of colored paper scattered in the carnivals on the screen. And whoever is able to catch a point from these points with the mouse pointer, he will have an attribute that expresses the state of feelings, and sometimes also the location of the person who expresses this feeling. When clicking on the captured point, the entire stored sentence opens. With another click on the same sentence, the user will go to the original website on which this person expressed his feelings.

The second mode continuously creates lists of the latest sensations collected, while the third mode includes images taken from the Internet sites that are the source of these images. And when the user clicks on these pictures, he moves to sentences that express the state of feelings.

The fourth mode creates menus for the combined sentiment groups. And in the fifth position, more than eight emotions are shown spreading over the last hours. The sixth and last mode displays each sense stored in the site's database in a step-by-step manner and arranged in frequencies. In all situations, the grouped sensations can be filtered according to the type of feeling, the gender, and age of the person who expressed it, as well as according to the weather, place, and date. To make the adjustments, a single click on the red bar in the upper photo frame is sufficient.

Temporary Love:

That electronic love is of three types: each party tries to get to know the secrets and facts of the other party, and that love ends when one of the two parties reaches the qualities he is looking for, while the second type of electronic love is considered temporary love in which an exchange of admiration takes place from one of the parties. The relationship of love is reciprocal until they reach a stage in which the words of love are repeated, and there are no longer any words they say or feelings to express, and this love ends with the end of the words of love and love.

There is a third type of this love, which is love resulting from an emotional emptiness that one of the parties takes as a means to kill time, and begins with admiration for what the other writes, with which the fate is thrown in his way, whether he is a girl or a young man, and this type ends in most cases by satisfying the instinct of passion only and does not end with a marriage.

Failed Relationships:

The Internet has caused a revolution in the world of love and romance and in the psychological and social concepts and practices that were stable in the minds until the matter became in need of review after the eyes of the eyes and the convergence of emotions faded, and the matter was limited to the Internet that was freed from all restrictions or social control or control by virtue of privacy That it provides for a young man and a girl.

The real problem with electronic love is the fabrication of love between the two parties, so no one can be sure that the other party loves him or is manipulating him, and the image that this person formed through the conversation is not the title of a successful

marriage, pointing out that there is a big difference between reality and imagination. Where the young man does not find his girl with the same morals, beauty, or behavioral commitment, and the opposite is also true for the girl, and the result is failed relationships that only a few marriages survive from.

Narcissists and the Virtual World:

Technological development has contributed to the rise of vanity, and social media has created another world for narcissists who want to make themselves the center of the world. The type of tweets that social media users post, their personal photos, and the density of their numbers, tell more about what goes on in their personal lives than the words themselves. It reveals how narcissistic people try to create the "reality" they want, which sometimes becomes a catalyst for them to reach what they want.

Technology has added many new options that have helped people express themselves and their concerns in different ways, yet it has contributed, by providing opportunities for self-promotion, to creating another world for narcissists who want to make themselves the center of the world, and their presence in it is extremely important. And experts believe that social media has become a mirror through which some people see themselves and seek attention and appear in the spotlight in various ways.

It suffices to take a quick tour of the social media space, to discover how social media affects narcissists so that they create a reality that is in the interest of preserving the image they have created about themselves and want to install it in the minds of the people around them.

There is a lot of evidence in recent studies conducted on social networking sites, and among this evidence is the increase in the number of words that indicate self-centeredness in tweets, as well as the increase in the obsession with taking self-pictures and the constant keenness to share all topics and ideas related to personal life with others. In a moment, researchers are led to conclude that technological development may have contributed to the rise of narcissism and vanity.

There are many studies confirming that the rate of narcissism is increasing significantly in the world, and the cumulative data have

proven that narcissists are more able to create the "reality" they want, which sometimes becomes a catalyst for them to communicate their thoughts to where they want.

There is a theory that explains how social media has contributed to increasing self-centeredness, especially among young people. This theory is called the "self-esteem movement", and this theory stresses that low self-confidence is the source of many problems facing societies, including addiction and hate for the community.

Social media gives subscribers a lot of time to evaluate their bodies and criticize their condition, and increase their desire to be like other people. Also, friends not expressing their likes or comments on their activities and pictures enhances their sense of being ignored and thus leads to low self-confidence. Other scientific evidence suggests that certain aspects of "narcissism" appear as a way to compensate for a person's feeling of personal weakness or lack of competence. And if these narcissists do not compensate themselves for their feeling of inferiority, the chances increase - in the long run - that they will not do well in life, especially if its course turns in an opposite direction to them.

In any case, it is not surprising that social media has become a mirror that reflects more important things about the personalities of its users, and if there is anything that can be inferred from the studies conducted in this regard, it is that the future will carry us more of what we can listen to, regarding The changes that social sites will make in the lives of generations, which we do not know much about today.

That social media causes narcissism or vice versa, in theory, we doubt the interest of the personality who possesses narcissistic tendencies prior to social media, even if the evidence available at the present time indicates the existence of a relationship between the two. Social networking sites are not designed for isolated people, they establish a relationship between users at the same time, and it seems that the narcissist has a pivotal role in the development of this field.

Social networking sites are not designed for isolated people, they establish a relationship between users at the same time, and it seems that the narcissist has a pivotal role in the development of this

field. The existence of human relationships only is not evidence that social media causes narcissism or vice versa, and in theory, we suspect that the character carried narcissistic tendencies prior to entering social networking sites, although the evidence available at the present time indicates the existence of a relationship between the two.

It is likely that the stories you heard about the narcissistic supreme personality on social media are true stories. When you deal with social media, you are dealing with narcissism in a greater volume than it is in reality, and this observation distorts your perception of the world and makes it more narcissistic than it is, as that boosting self-confidence can be developed through these sites.

Many use social networking sites a lot, as they see that these sites may have a positive impact on the self-esteem of the user of these sites because it often shows a positive version of themselves and also can enhance their confidence in themselves. Narcissism may be characterized by some for other factors, and social media does not affect the increase or formation of narcissism for some.

We all have narcissistic tendencies, and we have become more aware of their qualities simply because of the spread of social networking sites, and he added: I cannot imagine that social networking sites may be a cause of personality disorder, but rather I see them as a means of expressing an opinion and a field in which we find the freedom to express our views. With regard to many personal and collective issues, some of them may be fateful, as is the case in citizens' reactions to some security events or political, economic, judicial decisions and others.

Fragile Love: The Real Love with the "Clicks":

Online love is a hypothetical case that lacks a lot of reality, since the advent of the computer and the spread of the Internet, electronic life gradually began to take a large part of our real life, and quickly overtook it as a means of communication and acquaintance and expanded to the emotional aspects. As social networking sites in recent years began to interfere in Human life on several levels, most notably the political, social, and social relationship formation that had a prominent role in the emergence of the phenomenon of love on the Internet.

Emotional relationships on the Internet do not achieve the model of loyalty, trust, safety, and reassurance, because, with the spread of social networks, the Internet gradually began to invade areas of everyone's life. It became a fundamental factor in reshaping our lifestyles, and even the way of thinking, the way of speaking and dealing, and among the spaces that the Internet was stormed by the emotional space, for with an electronic world that is an alternative to reality with more and better features than reality, social media has become an opportunity to create new human relationships, including necessarily emotional relationships.

There are many things that a hypothetical and unreal relationship lacks, including a sense of security, as the possibility of harm is present all the time in online dealings, as there is no complete confidence all the time that the person being spoken to is the same person who portrays it to you. Either through his pictures, or his definition of himself on his personal page, the feeling of insecurity increases, and the psychological feeling whose determinants exceed the fear of material damage to other emotional matters, which makes Internet relationships doomed to failure, since emotional relationships, like other types of human relationships, need Basically it enhances the feeling of safety.

The reasons for the success of any emotional relationship are multiple, and it may differ from one person to another according to what he deems appropriate for his personal requirements, but the thing without which a truly authentic relationship cannot be established is trust, which needs many components that cannot be built overnight, including direct communication between The two parties.

On the Internet, the possibilities of deception are high because of its ease, the fact that the person deals with something intangible, and the truth of his identity or existence cannot be confirmed at all, as well as the feelings in those hypothetical relationships, are often illusory and unreal, for example, the image that the person presents to himself Mostly, every person likes to present himself to others as best he can, as best he is able to do that, and he finds the opportunity on social networks and the Internet.

Internet relationships depend on fictitious fulfillment, which is the first indicator that the relationship continues in the right direction in terms of seriousness and strength, and the two parties' attachment to each other, and their commitment to the relationship. Human and social relations are governed by real and realistic matters, which are difficult to convert into a group of numbers, letters, or images.

The problem with emotional relationships on the Internet is that it does not in any way achieve the model of loyalty, trust, safety, and reassurance, and there are many excuses: the disconnection from the Internet. Not being in front of the computer, sudden travel, and many excuses that may be appropriate to end that relationship.

The explanation for this is about the formation of emotional relationships on the Internet, that sometimes it begins with discussions on social networks on general topics, then these discussions turn into emotional relationships, and this is likely to happen and does not seem strange, because this topic depends on the type of users of these sites, and the extent of the existence of common interests. Between them and their similar beliefs, it is natural for them to feel emotional tendency, especially with the presence of emotional readiness on both sides, indicating that these relationships endure success and failure.

The formation of relationships via the Internet and social media, including emotional relationships, comes as one of the reflections of the widespread and widespread presence of these means and the space that they occupy in our lives, as they have become imitating reality, but surpassing it and taking its place among many of the current generations.

Regarding society's acceptance of this type of relationship, Darwish clarifies that society does not have actual options to accept this, and it has to adapt to this matter, pointing out that in sociology currently studying a new branch called "robotic sociology", which deals with the social relationships that arise on the Internet.

The emotional relationships on social networking sites are an illusion that the owner tries to mimic reality, but he often fails, since acquaintance and communication from behind the screens of digital devices and computers are very different from reality, so it is related to psychological and social aspects that cannot be crossed. That the

people who are involved in a romantic relationship via the Internet are virtual people, even if they are not actually like this, but by virtue of the medium of communication, they are hypothetical, linked in a virtual relationship through a virtual world.

Love stories always remain exciting and the signal of the beginning of love can never be controlled, but with the transformation of the world to a small electronic screen, whether laptops or smartphones, and with the emergence of social networking sites, the world has become open more than ever before, and the sparks started every time and time. Rather, relationships are sometimes transcontinental and break barriers of time, space and language.

The Fake Image:

With the development of social media, video calls through various applications have become easier than ever, but whoever said that speaking remotely reveals the falsehood, each party remains expressing itself in the way it wants, and it is not necessary for you to really be this reality, so no party knows. The other side of his personality is that he is talking to via optical fibers.

Who is really? What is the real nature of his life? How does he live? Who is his circle? Does he say everything or hide something? These and other questions remain unanswered, especially with the distances involved.

The easiest feelings that any person can feed into the other are feelings of admiration that make the picture beautiful and bright, something that can never be experienced from a distance because relationships of this kind are fueled by dreams and romance more than facts and realism.

Expectations Ceiling:

One of the great dangers of love on the Internet and social media is the high ceiling of expectations due to rosy promises, which are often without foundation or guarantees, which results in strong disappointment.

The evidence for this is not from the various radio programs that show in his episodes many of these cases, which tell young people and girls alike how disappointed and traumatized by online

relationships, which sometimes develop to be greater losses such as fraud or swindling of one party on the other.

Is failure inevitable?

We cannot reach an inevitable conclusion, which is a failure in this type of relationship, and generalization is basically rejected, but there are exceptions that may end happily, because the matter relates to many factors, and can this relationship be transferred to reality in order to take serious steps.

Dating and making friends over the Internet has been a natural thing for many years, intercontinental friendships, people of all languages and races exchange conversations and share common interests over the Internet, and friendships between young men and girls can sometimes turn into a love relationship, and here each case can be judged alone.

But given the many problems that are caused by online love relationships in most cases, and although feelings of love are a unique state and cannot be controlled at all, these feelings must be scrutinized and attempted to restrain them and subject them to the mind to research whether or not this relationship succeeds. It will inevitably fail, especially since its psychological consequences may be very dangerous and harmful to one or both parties.

Fake Relationships:

We are talking about all Sunni ages, but there is a group that can fall into a trap that will destroy their lives in the future, which is the category of teenagers because there are some sites and applications that do not ask to reveal the identity of the person or put a real picture or any proof that the character is real and its data is correct, which is What opens the door to impersonation or lying and deception.

For example, a teenager may claim to be a girl, to get to know other girls, and one of the parties may fall into the trap of fraud or attempted kidnapping when setting an interview, or sexual exploitation and other risks that result from this delusional relationship.

Therefore, there must be strict control over adolescents' use of the Internet, especially with the development of cybercrime, which may fall into the net of children, especially with the absence of the

role of parents in setting limits for their children's use of the Internet under severe control.

Golden Tips:

Many psychologists and sociology experts and medical professionals provide golden advice to young men and girls alike in an effort to help them.

Sincere love relationships cannot contain inappropriate questions or have inappropriate suggestions.

- Normal relationships between young men and women should not include pornographic or sexual words, even if they are part of the banter.

Complementation has certain limits, but exaggeration may reach the level of harassment, especially from young people.

Each party must try in every way to verify the truth of the other party so that the relationship cannot be based on false information.

- Try to speak together in audio and video if possible, because there can be, even in a simple way, to verify the truth or lie of the other party.

Pretending and trying to beautify the image will never help if the relationship develops and becomes realistic and you begin to get acquainted with the intention of the relationship.

- Set red lines in the relationship for each party that no one should go into.

- You must use documented sites or applications, and it is better to use paid sites that require the registration of a real identity for the person.

- If the matter develops and you agree to meet, one of your friends should be with you, especially girls.

- It is possible to verify the identity of the person if his accounts on social media are real and interactive, and he shares photos, moments, and posts with family and friends.

Victims on Both Sides:

Girls face many difficulties in love relationships on the Internet and social networking sites, during the search for the dream knight and the dream girl, and there are many problems that every girl and every young man will face in this type of relationship, so the first step if it results in choosing the wrong person will take place after A series

of errors, and it may develop from just an Internet conversation to phone calls and then encounters that can lead to falling into the forbidden.

Exhaustion to Follow Up Online:

In the past, eyestrain and stiff shoulders were typical symptoms caused by excessive internet access. However, in modern times, more mental symptoms have become more prominent, and "Internet addiction" is a typical example.

Internet addiction is a symptom of being addicted to the Internet and interfering with work or housework, or being frustrated or anxious due to the Internet. After that, it is estimated that Internet addiction is rapidly increasing and diversifying due to the spread of smartphones and tablet terminals.

In many countries, internet addiction is regarded as a disease that requires treatment, and countermeasures have been considered from early on. In recent years, youth addiction to the Internet has become a social problem in Japan as well, but in fact, many middle-aged and older people are also addicted to it.

The trouble with internet addiction is that it's easy to fall into addiction without even realizing it. There are various forms of addiction, such as continuing to use the Internet for a long time, being attracted to the excitement and excitement peculiar to the world of the Internet, being hypersensitive to information (anger, attachment, etc.), and being unable to stop tweeting and writing. It is complicated.

On the other hand, regarding the effects on the body, new problems such as damage to the retina due to the blue light of the display and promotion of osteoporosis due to immobility for a long time have been pointed out.

Middle-aged and older people need to be careful both physically and mentally, so be aware of the effects of overdoing the Internet.

Not to overdo the internet

To prevent overdoing the internet, keep the following in mind:

Limit Personal Internet Time:

The basis of prevention is to limit internet time. Let's decide that the total personal internet time other than work and necessary research is about 2 hours a day. If you can't keep it, be aware that you are dependent on the internet and consider going to a

psychosomatic medicine department. It can also be an opportunity to find out why you depend on the Internet (such as worries about work or relationships).

After An Hour on the Internet, Do Some Light Exercise:

Set a timer, and after an hour on the Internet, get in the habit of doing light exercises such as stretching and squats for 5 to 10 minutes away from your seat. Hydration is also important during hot weather. Not only does it reduce the impact on your body, but you can also stay away from your seat to stay away from the Internet.

Keep Your Meal Time Properly and Eat Elsewhere:

The meal is an important opportunity to move away from the Internet. Skipping meals and staying on the Internet while eating snacks is a typical case of internet addiction. Eat meals and snacks away from your seat and elsewhere.

Do Not Use the Internet on the Move, Such As Walking Smartphones:

It's time to get away from the internet and rest your nerves when you're on the go. In addition, there are an increasing number of accidents in which people or bicycles are hit by operating smartphones while walking, or they fall off stairs or platforms. As you grow older, your reflexes will decline and you are at greater risk of collisions and falls, so be sure to stop the internet on the move.

Have a Hobby Other Than the Internet:

Many people who are crazy about the Internet have no other hobbies and the Internet itself is the purpose. Keep in mind that you can have a hobby that allows you to spend time away from the Internet, such as going out and interacting with nature, exercising, going to exhibitions, or meeting and interacting with people.

Addiction Has The Following Effects On The Mind And Body:

Impact on the Mind:

Become misanthropic

Causes depression and other psychosomatic disorders

You lose control of your emotions

You will not be able to read the other person's facial expression

I can't express my feelings well

Lose thinking ability

Become aggressive

There is a gap between the common sense in the real world and the internet society

Relationship with the real world becomes troublesome

Effects on the Body:

Eyes become worse

Lack of exercise

Headache

Stiff shoulders (may cause depression when severe)

I'm tired from lack of sleep

Malaise

Risk of juvenile amnesia

Sociality:

Can't get up in the morning due to a lack of sleep

Can't go to school (a refusal to go to school), I can't go to work

Lose the ability to interact with ordinary people

Brain Fatigue Caused By Overlooking a Smartphone:

It seems that the number of people with "brain fatigue" due to overlooking smartphones is increasing. Apparently, the smartphone is causing the brain to become excited and tired. Therefore, the best way to get rid of brain fatigue is to get a good night's sleep. This is a must-see for those who are looking too much at their smartphones, as well as those who are worried that they will not get tired for some reason!

Have you ever felt any physical problems such as "I'm tired of my eyes", "I'm feeling heavy recently", "I don't feel like sleeping", or "I have a lot of forgetfulness with my head dull"?

Actually, it may be caused by "brain fatigue" that occurs when you look at your smartphone or computer for a long time, such as internet surfing. Moreover, if the disorder continues, any person may be involved in illness. When the autonomic nerves in the brain give a sign, I feel sick.

In the first place, the tiredness that you feel in your daily life is not in your body, but in your brain. The autonomic nerves that regulate blood pressure and body temperature to keep your body normal are tired. The message from the autonomic nerves of the brain is a feeling of fatigue.

It's surprising that tiredness occurs in the brain, not the body! So what exactly causes "brain fatigue"? "Smartphones and personal computers are no longer indispensable in work and daily life. This is a major factor that causes brain fatigue.

The amount of information that can be obtained from smartphones and personal computers is infinite and enormous. The trendy video apps display information one after another according to your interests and interests, but this will cause your brain to remain awake and excited for a long time. As a result, the autonomic nerves that maintain tension and concentration get tired.

Furthermore, if the awakening/excitement of the brain continues for a long time, fatigue will increase. Woke up and said, "Stop this situation early! 』 Send a sign from the brain. This is "brain fatigue".

In addition to operating your smartphone for a long time, when you feel tired in your life such as work or sports, you may feel "tired" or sleepy. Getting bored and sleepy can be said to be the first sign of fatigue.

The brain is sending the message "rest your body" in every way. So what happens if you keep ignoring this message from your brain? "If the autonomic nervous system continues to be overworked, various physical disorders such as headache, stiff shoulders, and poor circulation will occur. It is also natural that you lose your concentration, forget about things, and lose motivation for anything.

..

If it gets worse, the risk of diabetes, high blood pressure, lifestyle-related diseases, etc. will increase, so be careful. It is important to receive the message from the brain and take a rest immediately. So what are the effective ways to prevent brain fatigue?

Emotions and Internet:

The Web has become a secret weapon in the public eye and regular daily existence. At social and individual levels, the Web encourages relational correspondence, gives amusement, and assists people with making new interpersonal organizations. Nonetheless, improper or unnecessary Web use may bring about Web fixation and negative life results. Individuals who have experienced issues in controlling their Web utilization and create issues in word related or scholarly execution and in social connections, just as mental and physical issues.

Undergrads may utilize the Web for examining, gaming, person to person communication, betting, visiting, shopping, and viewing explicit recordings. In any case, given that understudies have free and boundless admittance to the Web, have adaptable timetables, and are liberated from their parents' impedance, they were distinguished as having a high danger for aggression.

There have numerous examinations analyzing the connection between the attack and character attributes, for example, neuroticism, honesty, suitability, fatigue inclination, marginal character qualities, fortification affectability, and dissatisfaction narrow-mindedness. Feeling guideline is the endeavor to change enthusiastic encounters by means of the inception, upkeep, or alteration of recurrence, force, or term of passionate encounters.

Troubles with feeling guidelines are accepted to be hazard factors for enslavement. Experts suggested that feeling guideline includes various originations, including (a) mindfulness and comprehension of feelings, (b) acknowledgment of feelings, (c) capacity to control indiscreet practices and carry on as per wanted objectives when encountering negative feelings, and (d) capacity to utilize situational fitting feeling guideline n procedures deftly to balance enthusiastic reactions as wanted so as to meet individual objectives and situational requests. The general nonattendance of any or these capacities would show the nearness of challenges in feeling guidelines.

Exploration has discovered that youngsters with more negative exposure had more trouble in recognizing and depicting feelings, understanding passionate responses, and controlling their indiscreet practices in light of negative enthusiastic encounters, and was less ready to utilize compelling feeling guideline procedures than teenagers without negative experience. It is conjectured that insufficient prefrontal intellectual control to stifle their negative feelings may bring about impulsivity and increment the danger of this negative experience. A two-year imminent examination likewise announced that passionate issues, for example, misery and social fear, foresee the event of negative experiences in young people.

Nonetheless, research likewise found that Web use is a typical system that individuals use to mitigate enthusiastic trouble. In the light of the standard of useful investigation in conduct brain research, numerous types of tricky practices and psychopathology can be conceptualized as endeavors to get away and dodge feelings, musings, recollections, and other private encounters. In fact, the harsh experiences are commonly viewed as an undesirable exertion to adapt to pressure and negative feelings, regardless of whether the negative experience disintegrates or improves the capacity of feeling guideline warrants overview.

Social Relations on Internet:

Specialists noticed that the web's many social positives bring problems in the field of social relations. The time invested online reduces energy from significant face-to-face relationships; the web enhances generally shallow relationships; the web encourages individuals to isolate themselves, restricting their exposure to new thoughts; and the web is being utilized to cause intolerance.

Other experts detailed that they certainly anticipate that innovative technology keeps on changing social relations online. Among the advances referenced were: holographic showcases and the transfer speed important to convey them; exceptionally secure and confided in quantum/biometric security; amazing synergistic perception choice based devices; perpetual, trusted, and boundless cloud file storage facilities; open organizations empowered by semantic web instruments in open area administrations; and moment thought transmission in a clairvoyant configuration.

Social relations, although fundamental to human nature, health, and prosperity, have gotten progressively convoluted because of changing populace demography and innovation. We quickly survey the advancement of hypothesis and estimation encompassing social relations just as early observational proof. We consider how social relations have changed after some time just as progression and change with respect to the essential qualities of social relations. Of unique strategies is the developing impact of innovation on how individuals keep in touch, particularly the changing ways individuals can utilize innovation to expand, decline, keep up, or stay away from social relations.

We consider both negative and positive parts of these new advancements and their effect on wellbeing and prosperity. At last, we presume that new and developing advances hold extraordinary guarantees for the future by defeating conventional boundaries to keeping in touch, uphold trade, and data securing.

All things considered, we alert that these new advancements can have the dehumanizing impact of separation accordingly making the potential for harshness and expanded antagonism. In total, we are

circumspectly hopeful about the guarantee of innovation to grow, yet not supplant, conventional types of social contact.

The nature of social relationships has changed since technological advances have given new techniques for contact. We should consider the advancement from in-person contact and letter keeping in touch with the message and phone and, most recently, to perpetually individualized and electronic types of contact, for example, video calls (e.g., Skype, FaceTime), and online media (e.g., Facebook). We know very little about how various types of communication impact social relations.

Moreover, there was an age relationship quality impact on phone contact with mate showing little distinction among more youthful individuals. Yet, more established individuals with low spousal positive relationship quality announcing fundamentally less phone contact with their life partner than those with a high spousal positive relationship quality. The discoveries concerning negative relationship quality were fairly however not totally equal. The degree of pessimism in the relationship didn't impact the recurrence of phone contact with companions among more seasoned individuals be that as it may, strangely, greater antagonism in the relationship was related to more phone contact with companions among younger people.

The intergenerational ties in families are changing, particularly those across multiple ages, and getting progressively remarkable. Despite more grown-ups are less inclined to receive new technologies, they might be propelled to do as such by intergenerational ties, e.g., to figure out how to utilize a cell phone or web-based media so as to keep in touch with youngsters and grandkids. The recent cross-public investigations showed that countries with a higher number of mobile phone memberships also had more significant levels of maternal contact by grown-up kids, especially girls.

Technology has the special potential to impact grandparent-grandchild connections because of more youthful ages' quicker selection of new advancements. Despite the fact that in-person correspondence keeps on being the most regular sort of contact for grandparents, cell phones, messaging, and email is getting

progressively famous as a method for keeping in contact with grandkids. Given the expanded portability of families and the converse connection between geographic closeness and in-person contact, more up to date correspondence advancements give a method by which grandparents can defeat obstructions of separation to keep up significant binds with younger generations.

New types of communication have made exceptional difficulties in getting connections. Electronic communication, for example, Facebook, texting, Snapchat, Skype, FaceTime, and have all made new opportunities to keep up contacts with close others. Mobile phones and email have in a general sense changed how and how frequently people convey. The low cost of these types of contact has brought about the practically widespread variation of a few, if not all, of these instruments of correspondence to keep in touch with loved ones. In any case, we know almost no about the impact of these new types of correspondence. The in addition to side, expanded correspondence can prompt less probability of seclusion, with a simple occasion to share the uplifting news, look for exhortation about issues, oversee medical issues, and for the most part appreciate trades with individuals we love.

It is also conceivable that people are losing the specialty of face-to-face contact, that people are more negative in less close to home types of correspondence, witness the ascent in cyberbullying on the grounds that they don't see another's responses. In spite of the fact that it is perceived that these public types of correspondence can be frightful, little is right now being done to limit such pessimism.

These are difficulties that plainly should be tended to. Fusing better approaches for having social relations into hypothesis, perceiving that the utilization and advantages of innovation probably change as indicated by close to home and situational attributes and that these new social relations will impact wellbeing in special manners speak to significant future headings. The new model gives an accommodating structure to considering the manners by which new advancements make new types of social relations. It is very evident that the appearance and advancement of new correspondence innovations give energizing and promising new headings for how we create, use, and experience social relations.

There is a strong replacement of time spent on face time with screen time as technological advancements have had an extreme influence on the manner people communicate. No doubt that the level of involvement is high of persons with their cell phones and other technologies and with each other in the face-to-face gathering.

We all notice the quick development of various technologies and their present usage throughout the world. Technology has an undesirable effect on the quantity and quality of face-to-face communication. More than 60% of people observed on stay to use portable mobiles in the existence of others. New advancements in communication technologies have allowed people to associate more easily with other people very far distances away. Yet, little is been recognized about how the frequent existence of these tools in social settings affects face-to-face relations.

The existence of portable communication tools in our social settings affects human relationships. The devices have unwanted effects on intimacy, joining, and dialogue quality, particularly noteworthy when people are falling in private meaningful topics. Individuals who had talks in the lack of their mobile stated sophisticated levels of empathetic anxiety, whereas those talking in the presence of mobiles reported fewer stages of sympathy. Even cell phone usage in the community might make persons more likely to connect with foreigners.

The different kinds of mobiles usages facilitated conversation with foreigners, for those who often depend on mobiles to get and exchange data about common subjects. Yes, there are noteworthy costs for their expansion of social abilities and their performance of self and private relationships. Many youngsters assumed their fathers and mothers paid less care to them than to their mobiles, oftentimes ignoring to communicate with them face-to-face till they had complete answering to electronic communications.

People become more dependent on interconnecting with families and friends via technology and are ignoring to involve privately, even once they actually in the company of others. A majority of people touched the excellence of their discussions decreased in the existence of technology, and countless people were worried when family members or friends use technology despite the fact they are

having time with each other. Moreover, about half of mobile addicted people talk more frequently with family and friends via technology than privately, telling strongly that face-to-face communications have degraded both in quantity and in quality.

Social Isolation by the Internet:

The impact of behavior of the Internet on sociality and aggression was growing. Excessive usage of the Internet generates people to bear from isolation, exhaustion and withdrawal symptoms. In recent years, the development of the internet has been remarkable. Studies of weblogs and online games made it clear that the use of the net reduces the relationship with family and friends and increases the feeling of loneliness and depression. Similarly, many studies focusing on addiction and addiction to the net shown that the use of nets can reduce various social activities and relationships with family and friends.

A new syndrome is revealing here which is Hikikomori Syndrome. It is a syndrome of long continuous social isolation. It happens basically from rarely leaving home to never leaving the room. It happens mainly for teenage boys and young men, and for those many of whom are addicted to online gaming. The overusing of the Web results in physical idleness and decreases having associations with others in reality and thus result in social isolation.

Excessive and unhealthy Web use would rise feelings of loneliness as time pass. Although despair had a reasonable and positive binary relationship with Web addiction at each time point, such a relationship was not noteworthy in many analyses. It is also discovered that online social contacts with close people and family members were not an active alternative for offline social communications in decreasing feelings of loneliness. Also, while an increase in face-to-face interactions could help to decrease indications of Web addiction, this consequence may be defused by the growth in online social interactions as a consequence of extreme Internet use. Taken as a whole, there is a strong link between loneliness and Internet addiction.

The danger of using nets to interfere with real-life interpersonal relationships has been identified. Furthermore, in recent years, the impact on aggression has also attracted attention, and it has been reported that the continuous use of nets, including offensive content

such as slander and slander, promotes aggressive recognition and actions.

From checking news and weather forecasts to searching for gourmet information and counseling about health concerns, information gathering through the Internet is now an integral part of our daily lives. Information on the Internet obtained through personal computers, mobile phones, and smartphones is highly immediate and more likely to reflect people's diverse values than other media. In addition, in the community on the Internet, where people with similar interests and values gather, new bonds are being created every day through the exchange of information and psychological support.

At first glance, our daily lives seem to have nothing to do with loneliness in a modern society where we live surrounded by a lot of information and can build bonds on the Internet. However, in recent years, the decline in interpersonal relationships among young people and the increase in the number of young people who fall into loneliness or isolation without building social ties have become major social problems, and countermeasures from all sides are urgently needed.

On the other hand, the tendency of people with a high sense of loneliness to actively use the Internet is becoming stronger due to the spread of social media such as Twitter and Facebook and other applications. However, people with a high degree of loneliness are more likely to be depressed and interpersonal stress and tend to have negative attitudes and beliefs about their interpersonal environment, and their use of the Internet is with others.

A large amount of information that comes into contact with the Internet puts an excessive burden on people's cognitive ability and mental and psychological health. There is a so-called "information explosion" which expanded 530 times. Furthermore, some news agencies issued reports entitled "Dying for information".

As a result of the net facing increased volume inside and outside daily communication, we may not be able to process the information received. It has been pointed out that we are stressed. A lot of information is digitized and archived. In a socialized society, we can find the information we want by proactively searching for information

using a search engine. It also leads to less satisfaction despite of the excessive flooding of information.
